Ceramic Materials C. Barry Carter, M. Grant Norton, 2007-10-23 Ceramic Materials Science and Engineering is an up to date treatment of ceramic science engineering and applications in a single integrated text. Building on a foundation of crystal structures, phase equilibria, defects and the mechanical properties of ceramic materials, students are shown how these materials are processed for a broad diversity of applications in today's society. Concepts such as how and why ions move, how ceramics interact with light and magnetic fields and how they respond to temperature changes are discussed in the context of their applications. References to the art and history of ceramics are included throughout the text. The text concludes with discussions of ceramics in biology and medicine, ceramics as gemstones and the role of ceramics in the interplay between industry and the environment. Extensively illustrated, the text also includes questions for the student and recommendations for additional reading.

KEY FEATURES Combines the treatment of bioceramics, furnaces, glass optics, pores, gemstones and point defects in a single text. Provides abundant examples and illustrations relating theory to practical applications. Molecular Physics W. Demtröder, 2005-12-02 The richly illustrated book comprehensively explains the important principles of diatomic and polyatomic molecules and their spectra in two separate distinct parts. The first part concentrates on the theoretical aspects of molecular physics such as the vibration rotation electronic states potential curves and spectra of molecules. The different methods of approximation for the calculation of electronic wave functions and their energy are also covered. The introduction of basics terms used in group theory and their meaning in molecular physics enables an elegant description of polyatomic molecules and their symmetries. Molecular spectra and the dynamic processes involved in their excited states are given its own chapter. The theoretical part then concludes with a discussion of the field of Van der Waals molecules and clusters. The second part is devoted entirely to experimental techniques such as laser Fourier NMR and ESR spectroscopies used in the fields of physics chemistry biology and material science. Time resolved measurements and the influence of chemical reactions by coherent controls are also treated. A list of general textbooks and specialized literature is provided for further reading. With specific examples definitions and notes integrated within the text to aid understanding this is suitable for undergraduates and graduates in physics and chemistry with a knowledge of atomic physics and familiar with the basics of quantum mechanics.
