Solving Higherorder Equations From Logic To Programming:

Solving Higher-Order Equations Christian Prehofer, 1998 This monograph develops techniques for equational reasoning in higher order logic. Due to its expressiveness higher order logic is used for specification and verification of hardware software and mathematics. In these applications higher order logic provides the necessary level of abstraction for concise and natural formulations. The main assets of higher order logic are quantification over functions or predicates and its abstraction mechanism. These allow one to represent quantification in formulas and other variable binding constructs. In this book we focus on equational logic as a fundamental and natural concept in computer science and mathematics. We present calculi for equational reasoning modulo higher order equations presented as rewrite rules. This is followed by a systematic development from general equational reasoning towards effective calculi for declarative programming in higher order logic and A calculus. This aims at integrating and generalizing declarative programming models such as functional and logic programming. In these two prominent declarative computation models we can view a program as a logical theory and a computation as a deduction.
