

# Somatic Diversification of Immune Responses

» Conservation of receptor diversity is achieved through somatic diversification. This involves the identification of a, conserved, and mutated copy within a given gene. This process involves the diversification of receptor specificity that is maintained through the use of silent mutations. This final step influences the likelihood that the receptor can evoke a specific behaviour in the same individual. This is achieved through the use of specific mutations that maintain receptor functionality while increasing specificity. »

## **Somatic Diversification Of Immune Responses:**

*Somatic Diversification of Immune Responses* Garnett Kelsoe, Martin Flajnik, 2012-12-06 Discovery of the mechanism for V D J hypermutation remains a basic goal of immunology despite the best efforts of many laboratories. The existence of catalyzed site specific mutation and its exploitation for the somatic evolution of lymphocytes are remarkable adaptations yet since the discovery of hypermutation in 1970 so much hard work has generated little. Indeed our knowledge of what is probably absolutely required for the mutator's action can be succinctly expressed: g gene enhancers. Table 1 of Winter et al's chapter puts into a historical perspective how our notions of the mutator have changed over the years. Despite these modest gains most of us feel that this is the best of times. Our work has not only shown us what the mutator is not; it has also like an artist's preliminary sketch defined the questions and experiments we must face without diminishing the potential for new biology. In short it is great fun to toil against a significant and enigmatic problem.

## **Leukocyte Integrins in the Immune System and Malignant Disease**

Bernhard Holzmann, Hermann Wagner, 1997-12-11 Most lymphocytes recirculate throughout the body migrating from blood through organized lymphoid tissues such as lymph nodes (LN) and Peyer's patches (PP) then to lymph and back to blood (GOWANS and KNIGHT 1964). Smaller numbers of lymphocytes migrate from blood to extranodal tissues such as pancreas and then through lymphatic vessels to LN (MACKAY et al 1990). An important feature of this migration is the ability of lymphocytes to recognize and adhere to the surface of blood vessel endothelial cells before migrating through the vessel wall into surrounding tissue (CARLOS and HARLAN 1994; IMHOF and DUNON 1995; BUTCHER and PICKER 1996). Adhesion interactions of vascular endothelium with lymphocytes under flow or shear consist of at least four steps: 1) an initial transient sticking or rolling; 2) if the lymphocytes encounter appropriate activating or chemotactic factors in the local environment, rolling may be followed by a lymphocyte activation step that then leads to 3) strong adhesion or sticking that may be followed by 4) lymphocyte diapedesis into tissue (BUTCHER 1991; SHIMUZU et al 1992; SPRINGER 1994; BARGATZE et al 1995). Specific lymphocyte and endothelial adhesion molecules (AM) are involved in each step of this adhesion cascade, reviewed in CARLOS and HARLAN 1994; IMHOF and DUNON 1995; BUTCHER and PICKER 1996. This allows lymphocyte migration to be controlled at several different steps leading to a combinatorial increase in specificity and sensitivity.

*Immune system modeling and analysis* Ramit Mehr, Miles Davenport, 2015-04-22 The rapid development of new methods for immunological data collection from multicolor flow cytometry through single cell imaging to deep sequencing presents us now for the first time with the ability to analyze and compare large amounts of immunological data in health, aging and disease. The exponential growth of these datasets however challenges the theoretical immunology community to develop methods for data organization and analysis. Furthermore the need to test hypotheses regarding immune function and generate predictions regarding the outcomes of medical interventions necessitates the development of mathematical and computational models covering processes on multiple scales from the genetic and molecular to the cellular and system scales.

The last few decades have seen the development of methods for presentation and analysis of clonal repertoires those of T and B lymphocytes and phenotypic surface marker based repertoires of all lymphocyte types and for modeling the intricate network of molecular and cellular interactions within the immune systems This e Book which has first appeared as a Frontiers in Immunology research topic provides a comprehensive online open access snapshot of the current state of the art on immune system modeling and analysis
