SOME PAPERS ON THE CEREBRAL CORTEX

Some Papers On THE CEREBRAL CORTEX

Translated from
the French and German by

GERHARDT VON BONIN

Professor of Anatomy, College of Medicine
University of Illinois, Chicago, Illinois

Selecting the papers mainly for their general interest and the breadth of outlook which they enable the reader to form, Professor von Bonin tells a consistent and interesting story.

It starts out with Pierre Flourens, then follows a purely anatomical paper by Retzius, and a more clinical paper by Broca. Then follows Fritsch and Hitzig, Munk, Golz, Meynert, Flechsig, Brodmann and von Monakow from the German and finally Ramon y Cajal from the French.

A paper by Leyton and Sherrington which is taken from English closes the book.

The struggle between holistic and biologic views is clearly mirrored in these papers and that should help to understand the major issues at stake.

Comparative Structure and Evolution of Cerebral Cortex Edward G. Jones, Alan Peters, 1990-10-31 The cerebral cortex especially that part customarily designated neocortex is one of the hallmarks of mammalian evolution and reaches its greatest size relatively speaking and its widest structural diversity in the human brain The evolution of this structure as remarkable for the huge numbers of neurons that it contains as for the range of behaviors that it controls has been of abiding interest to many generations of neuroscientists Yet few theories of cortical evolution have been proposed and none has stood the test of time In particular no theory has been successful in bridging the evolutionary gap that appears to exist between the pallium of nonmammalian vertebrates and the neocortex of mammals Undoubtedly this stems in large part from the rapid divergence of non mammalian and mammalian forms and the lack of contemporary species whose telencephalic wall can be seen as having transitional characteristics The monotreme cortex for example is unquestionably mammalian in organization and that of no living reptile comes close to resembling it Yet anatomists such as Ramon y Cajal on examining the finer details of cortical structure were struck by the similarities in neuronal form particularly of the pyramidal cells and their

Microstructural Parcellation of the Human Cerebral Cortex Stefan Geyer, Robert Turner, 2013-07-04 Unraveling the functional properties of structural elements in the brain is one of the fundamental goals of neuroscientific research In the cerebral cortex this is no mean feat since cortical areas are defined microstructurally in post mortem brains but functionally in living brains with electrophysiological or neuroimaging techniques and cortical areas vary in their topographical properties across individual brains Being able to map both microstructure and function in the same brains noninvasively in vivo would represent a huge leap forward In recent years high field magnetic resonance imaging MRI technologies with spatial resolution below 0.5 mm have set the stage for this by detecting structural differences within the human cerebral cortex beyond the Stria of Gennari This provides the basis for an in vivo microanatomical brain map with the enormous potential to make direct correlations between microstructure and function in living human brains This book starts with Brodmann's post mortem map published in the early 20th century moves on to the almost forgotten microstructural maps of

von Economo and Koskinas and the Vogt Vogt school sheds some light on more recent approaches that aim at mapping cortical areas noninvasively in living human brains and culminates with the concept of in vivo Brodmann mapping using high field MRI which was introduced in the early 21st century
