

Lanczos Iteration - Theory

The matrices Q_k generated by the Arnoldi iteration are reduced QR-factors of the Krylov matrix:

$$K_k = Q_k R_k$$

The tridiagonal matrices T_k are the corresponding projections

$$T_k = Q_k^* A Q_k$$

And the successive iterates are related by the formula

$$A Q_k = Q_{k+1} \begin{bmatrix} T_k \\ \beta_k e_k^* \end{bmatrix} = Q_k T_k + \beta_k q_{k+1} e_k^*$$

Iteration Theory:

Iteration Theories Stephen L. Bloom, Zoltan Esik, 2012-12-06 This monograph contains the results of our joint research over the last ten years on the logic of the fixed point operation. The intended audience consists of graduate students and research scientists interested in mathematical treatments of semantics. We assume the reader has a good mathematical background although we provide some preliminary facts in Chapter 1. Written both for graduate students and research scientists in theoretical computer science and mathematics, the book provides a detailed investigation of the properties of the fixed point or iteration operation. Iteration plays a fundamental role in the theory of computation for example in the theory of automata in formal language theory in the study of formal power series in the semantics of flowchart algorithms and programming languages and in circular data type definitions. It is shown that in all structures that have been used as semantical models the equational properties of the fixed point operation are captured by the axioms describing iteration theories. These structures include ordered algebras, partial functions, relations, finitary and in finitary regular languages, trees, synchronization trees, 2-categories and others. *Topics in Iteration Theory* György I. Targonski, 1981 *Iteration Theory (ECIT '06)* Gian Luigi Forti, 2007 **Semantics for Concurrency** Marta Z. Kwiatkowska, Michael W. Shields, Richard M. Thomas, 2013-03-14 The semantics of concurrent systems is one of the most vigorous areas of research in theoretical computer science but suffers from disagreement due to different and often incompatible attitudes towards abstracting non sequential behaviour. When confronted with process algebras which give rise to very elegant highly abstract and compositional models traditionally based on the interleaving abstraction, some argue that the wealth of contribution they have made is partially offset by the difficulty in dealing with topics such as fairness. On the other hand, the non interleaving approaches based on causality although easing problems with fairness and confusion still lack structure, compositionality and the elegance of the interleaving counterparts. Since both these approaches have undoubtedly provided important contributions towards understanding of concurrent systems, one should concentrate on what they have in common rather than the way they differ. The International Workshop on Semantics for Concurrency held at the University of Leicester on 23-25 July 1990 was organised to help overcome this problem. Its main objective was not to be divisive but rather to encourage discussions leading towards the identification of the positive objective features of the main approaches in the hope of furthering common understanding. The Workshop met with an excellent response and attracted contributions from all over the world. The result was an interesting and varied programme which was a combination of invited and refereed papers. The invited speakers were Prof. Dr. E. Best (Hildesheim University), Prof. Dr. A. **Iteration Theory (Ecit 91) - Proceedings Of The European Conference** J. P.  Iteration theory has its roots in the operation of substituting functions into itself This has led to questions like that of the
 behaviour of functions by repeating this substitution and when the number of iterations tends to infinity The terms orbit and
 chaos appropriately describe this behaviour Dynamical systems and the theory of functional equations play important roles in
 this field Selected Papers Calvin C. Elgot,2012-12-06 Cal Elgot was a very serious and thoughtful researcher who with
 great determi nation attempted to find basic explanations for certain mathematical phenomena as the selection of papers in
 this volume well illustrate His approach was for the most part rather finitist and constructivist and he was inevitably drawn
 to studies of the process of computation It seems to me that his early work on decision problems relating automata and logic
 starting with his thesis under Roger Lyndon and continuing with joint work with Biichi Wright Copi Rutledge Mezei and then
 later with Rabin set the stage for his attack on the theory of computation through the abstract treatment of the notion of a
 machine This is also apparent in his joint work with A Robinson reproduced here and in his joint papers with John
 Shepherdson Of course in the light of subsequent work on decision problems by Biichi Rabin Shelah and many many others
 the subject has been placed on a completely different plane from what it was when Elgot left the area But I feel that his
 papers results and style were very definitely influential at the time and may well have altered the course of the investigation
 of these problems As Sammy Eilenberg explains the next big influence on Elgot s thinking was category theory which gave
 him a way of expressing his ideas in a sharply algebraic manner The joint book with Eilenberg is one illustration of this
 influence **Iteration Theory and Its Functional Equations** Roman Liedl,Ludwig Reich,György I. Targonski,1985
