most people don't realize is that this effect is not limited within the planet's atmosphere; it may also affect Earth's journey through space. In *Global Warming and Earth's Evolution*, author Graham Winston reveals that the bigger picture is bigger than Global Warming and Global Warming is only the tip of the iceberg of Earth's own challenges. The book describes the real truths of Global Warming: it is mainly caused by man's unnecessary destruction of natural resources. Earth depends on being in a good condition to successfully complete its next evolution cycle. The book explains the importance of the cycles and what evolutionary changes occurred on Earth. Many previous unexplained phenomena could be linked to Earth's evolutionary cycles. The extinction of the dinosaur, the birth of the Grand Canyon, why has no large object recently collided with the Moon when millions of craters exist on the Moon? Why has the impacts stopped and when will the impacts start happening again? These and other fascinating examples of unsolved phenomena will open the minds of many readers to this new dimension of thinking: what happened on Earth millions of years ago and whether Earth will survive the next evolutionary cycle. Global Warming has caused a negative effect on Earth's natural defense mechanism. Earth depends on surviving the severe challenges when close to the core of the Milky Way Galaxy. About the Author: Graham Winston's professional experience spans over 20 years and involves solving complex problems. To achieve success in these business fields, Winston solved many complex problems. The common skill applied across these fields was the development of innovative thinking. This later led to applying these same problem-solving techniques on Global Warming and Earth's evolution cycles to understand the relationship between Global Warming and Earth's own evolutionary journey as Earth travels across the Universe. **Statistical**

**Validation of Speeds and Travel Times Provided by a Data Services Vendor**, 2010. The provision of real-time traffic and travel time information is becoming increasingly important in urban areas as well as in freight significant intercity corridors. However, the high cost to install and maintain roadway-based traffic sensors has prevented widespread availability of real-time traffic information in these areas. A market for real-time traffic information is emerging in the United States and several private companies are gathering and distributing traffic information independently of public sector transportation agencies. In this study, floating car probe data and newly developed Bluetooth device matching methods are developed and used to collect travel times and speeds for 103 centerline miles located in Dayton, Ohio. This reference data are then statistically evaluated with a data service vendor's reported travel times and speeds for 36 travel time segments. Access, 2003
