Figliola,Donald E. Beasley,2014-12-15 Figliola and Beasley s 6th edition of Theory and Design for Mechanical Measurements provides a time tested and respected approach to the theory of engineering measurements An emphasis on the role of statistics and uncertainty analysis in the measuring process makes this text unique While the measurements discipline is very broad careful selection of topical coverage establishes the physical principles and practical techniques for quantifying many engineering variables that have multiple engineering applications In the sixth edition Theory and Design for Mechanical Measurements continues to emphasize the conceptual design framework for selecting and specifying equipment test procedures and interpreting test results Coverage of topics applications and devices has been updated including information on data acquisition hardware and communication protocols infrared imaging and microphones New examples that illustrate either case studies or interesting vignettes related to the application of measurements in current practice are introduced

**SAE Aerospace Standards** ,1988 **Measuring, Modeling and Predicting the Seismic Site Effect** Yefei Ren,Giovanni Lanzano,Yadab P. Dhakal,Behzad Hassani,Kun Ji,2024-01-25 As recognized universally by both seismology and earthquake engineering communities the amplitude and frequency content of ground motions are influenced by local site effects including the effects of near surface geologic materials surface topographic and basin effects and so on Strong linkage between seismic site effect and earthquake damage has been commonly demonstrated from many past earthquakes Therefore quantitative and reliable evaluation of the seismic site effect is one of the crucial aspects in seismic hazard assessment and risk mitigation With the significant advancement of modern seismic monitoring networks and arrays huge amounts of high quality seismic records are now being accumulated This encourages us to measure the site responses and its associated uncertainty for selected seismic stations by some record dependent approaches such as horizontal to vertical spectral ratio HVSR measurements generalized spectral inversion GIT methods etc Machine learning techniques also show significant promise in characterization of the near surface geologic properties and prediction of site response These data

driven approaches help us to better understand the physics of spatial and temporal variabilities of ground motions Due to more and more site specific data being captured invoking non ergodic assumptions in seismic response analysis has recently been a topic of great interest in the community For specific site response analysis numerical simulations are carried out to model the dynamic process of seismic waves propagating and scattering in the subsurface strata With development of modeling capacity great efforts have been taken to evaluate quantitatively the complex 2D and 3D effects on seismic site response
