Teaching And Learning Science:

Teaching and Learning about Science Derek Hodson,2009-01-01 Findings generated by recent research in science education international debate on the guiding purposes of science education and the nature of scientific and technological literacy official and semi official reports on science education including recommendations from prestigious organizations such as AAAS and UNESCO and concerns expressed by scientists environmentalists and engineers about current science education provision and the continuing low levels of scientific attainment among the general population have led to some radical re thinking of the nature of the science curriculum There has been a marked shift of rhetorical emphasis in the direction of considerations of the nature of science model based reasoning inquiry based learning scientific argumentation and the use of language rich learning experiences reading writing talking to enhance concept acquisition and development These findings arguments and pronouncements seem to point very clearly in the direction of regarding science education as a study of scientific practice This book presents a comprehensive research based account of how such a vision could be assembled into a coherent curriculum and presented to students in ways that are meaningful motivating and successful The author takes what might be described as an anthropological approach in which scientists are studied as a socially economically and politically important community of people This group has its own distinctive language body of knowledge investigative methods history traditions norms and values each of which can be studied explicitly systematically and reflectively This particular approach was chosen for the powerful theoretical overview it provides and for its motivational value especially for students from sociocultural groups currently under served by science education and under represented in science The book which is both timely and important is written for teachers student teachers graduate students in education teacher educators curriculum developers and those responsible for educational policy It has the potential to impact very substantially on both pre service and inservice science teacher education programmes and to shift school science education practice strongly in the direction currently being advocated by prominent science educators

Progressing Science

Education Keith S. Taber,2009-05-29 Exploring one of the central themes in science education theory this volume examines how science education can be considered as a scientific activity within a broad post positivist notion of science Many students find learning science extremely problematic whatever level of education they have reached At the end of the 1970s a new approach to tackling learning difficulties in science was developed drawing on ideas from psychology and cognitive science and centred on the way students build up new knowledge in reference to their existing ideas Constructivism became the dominant paradigm in science education research for two decades spawning a vast body of literature reporting aspects of learners ideas in different science topics However Constructivism came under fire as it was recognised that the research did not offer immediate and simple prescriptions for effective science teaching The whole approach was widely criticised in particular by those who saw it as having anti science leanings In this book the notion of scientific research programmes is

used to understand the development limitations and potential of constructivism It is shown that constructivist work in science education fits into a coherent programme exploring the contingencies of learning science The author goes further to address criticisms of constructivism evaluate progress in the field and suggest directions for future research It is concluded that constructivism has provided the foundations for a progressive research programme that continues to guide enquiry into learning and teaching science

Teaching and Learning Science Judith Bennett,2005-12-07 There is increasingly wide agreement among teachers researchers inspectors advisers and policy makers that both teaching and research will benefit from being brought closer together But how can this be achieved Hard pressed practitioners cannot be expected to review a constant flow of conference papers journals and other publications even if such items were accessibly written This unique book synthesizes relevant research findings for the professional practitioner and highlights their implications for the quality of teaching and learning Whether you are a teacher looking to enhance your practice or a researcher looking for a concise overview of or a researcher looking for a concise overview of the literature this book will be a valuable acquisition

The Professional Knowledge Base of Science Teaching Deborah Corrigan,Justin Dillon,Richard Gunstone,2011-03-01 Over the past twenty years much has been written about the knowledge bases thought necessary to teach science Shulman has outlined seven knowledge domains needed for teaching and others such as Tamir have proposed somewhat similar domains of knowledge specifically for science teachers Aspects of this knowledge have changed because of shifts in curriculum thinking and the current trends in science education have seen a sharp increase in the significance of the knowledge bases The development of a standards based approach to the quality of science teaching has become common in the Western world and phrases such as evidence based practice have been tossed around in the attempt to measure such quality The Professional Knowledge Base of Science Teaching explores the knowledge bases considered necessary for science teaching It brings together a number of researchers who have worked with science teachers and they address what constitutes evidence of high quality science teaching on what basis such evidence can be judged and how such evidence reflects the knowledge basis of the modern day professional science teacher This is the second book produced from the Monash University King s College London International Centre for the Study of Science and Mathematics Curriculum The first book presented a big picture of what science education might be like if values once again become central while this book explores what classroom practices may look like based on such a big picture

Issues and Challenges in Science Education Research Kim Chwee Daniel Tan, Mijung Kim, 2012-04-27 In contemporary society science constitutes a significant part of human life in that it impacts on how people experience and understand the world and themselves The rapid advances in science and technology newly established societal and cultural norms and values and changes in the climate and environment as well as the depletion of natural resources all greatly impact the lives of children and youths and hence their ways of learning viewing the world experiencing phenomena around them and interacting with others These changes challenge science educators to rethink the epistemology and pedagogy in science classrooms today as the practice of science education needs to be proactive and relevant to students and prepare them for life in the present and in the future Featuring contributions from highly experienced and celebrated science educators as well as research perspectives from Europe the USA Asia and Australia this book addresses theoretical and practical examples in science education that on the one hand plays a key role in our understanding of the world and yet paradoxically now acknowledges a growing number of uncertainties of knowledge about the world The material is in four sections that cover the learning and teaching of science from science literacy to multiple representations science teacher education the use of innovations and new technologies in science teaching and learning and science learning in informal settings including outdoor environmental learning activities Acknowledging the issues and challenges in science education this book hopes to generate collaborative discussions among scholars researchers and educators to develop critical and creative ways of science teaching to improve and enrich the lives of our children and youths
