Techniques For Engineering Genes:

Genetics and Genetic Engineering Tomas Cannon, 2018-12-01 Genetics and Genetic Engineering explores the great discoveries in genetics the study of genes and the inherited information they contain Genetic engineering alters the genetic make up of an organism using techniques that remove heritable material or that introduce DNA prepared outside the organism either directly into the host or into a cell that is then fused or hybridized with the host This involves using recombinant nucleic acid DNA or RNA techniques to form new combinations of heritable genetic material followed by the incorporation of that material either indirectly through a vector system or directly through micro injection macro injection and micro encapsulation techniques Genetic engineering also called genetic modification is the direct manipulation of an organism s genes using biotechnology It is a set of technologies used to change the genetic makeup of cells including the transfer of genes within and across species boundaries to produce improved or novel organisms New DNA is obtained by either isolating or copying the genetic material of interest using recombinant DNA methods or by artificially synthesizing the DNA A construct is usually created and used to insert this DNA into the host organism The first recombinant DNA molecule was made by Paul Berg in 1972 by combining DNA from the monkey virus SV40 with the lambda virus As well as inserting genes the process can be used to remove or e knock oute genes The new DNA can be inserted randomly or targeted to a specific part of the genome This book will prove equally useful for physicians nurses animal breeders and laboratory technicians in fact everyone whose daily work involves genetics and genetic engineering

Techniques for Engineering Genes K. M. A. Gartland, 1993 Uses a sequential approach to engineering genes Explains how genetic material may be extracted from a variety of sources and how this DNA may be fragmented and purified The techniques available are described along with the procedures that may be employed This leads to a description of how genes may be re constructed and introduced back into the living system Important ethical and regulatory issues are also discussed Step by step logical development Student centered learning style The need for a cost effective training scheme for new and existing staff at all levels has been met by the University of Greenwich formerly Thames Polytechnic and the Open University of the Netherlands As part of the European Community Education and Technology Training initiative COMETT and in conjunction with a number of other leading UK and European universities have developed BIOTOL a training scheme in biotechnology using open learning materials which will provide tailor made courses flexible in content pace and place
