

Operation

1. Intake and compression occur in the compressor as the impeller rotating at high speed pulls in ambient air and compresses it. The turbine compressor is a single-stage centrifugal compressor.

2. To aid in providing the lowest fuel consumption, a rotating regenerator is added, which takes heat from the exhaust and uses it to preheat the incoming air to the combustion chamber. This conservation of exhaust heat significantly improves fuel economy.

3. The gas turbine has a separate combustion section—and within this section, fuel is added; and the combustion process takes place at a constant pressure.

4. The higher volume of hot gases then passes to the gasifier turbine—or first stage turbine—where the expansion of gases produces power to drive the compressor and the engine accessories.

5. The power turbine, located behind the gasifier turbine, drives the auxiliary accessories and through reduction gearing is connected to the load. The power turbine shaft can be stalled without affecting the gasifier shaft. At stall, the power turbine produces maximum torque.

6. The unique feature in Allison GT 404/505/605 industrial gas turbines is Power Transfer. By introducing Power Transfer into the cycle, there is a positive mechanical linkage, through a hydraulic clutch pack, between the gasifier and power turbine shafts. The clutch plates can be engaged or continuously slipped. This capability provides a big advantage in part load fuel economy since it keeps operating temperatures close to their design point and it enables the engine to act as a dynamic brake.
