**Machine Intelligence** Andy Clark, Toribio, 2012-11-12 Summarizes and illuminates two decades of research. Gathering important papers by both philosophers and scientists, this collection illuminates the central themes that have arisen during the last two decades of work on the conceptual foundations of artificial intelligence and cognitive science. Each volume begins with a comprehensive introduction that places the coverage in a broader perspective and links it with material in the companion volumes. The collection is of interest in many disciplines including computer science, linguistics, biology, information science, psychology, neuroscience, iconography, and philosophy. Examines initial efforts and the latest controversies. The topics covered range from the bedrock assumptions of the computational approach to understanding the mind to the more recent debates concerning cognitive architectures all the way to the latest developments in robotics, artificial life, and dynamical systems theory. The collection first examines the lineage of major research programs beginning with the basic idea of machine intelligence itself, then focuses on specific aspects of thought and intelligence, highlighting the much-discussed issue of consciousness, the equally important but less densely researched issue of emotional response, and the more traditionally philosophical topic of language and meaning. Provides a gamut of perspectives. The editors have included several articles that challenge crucial elements of the familiar research program of cognitive science as well as important writings whose previous circulation has been limited. Within each volume, the papers are organized to reflect a variety of research programs and issues. The substantive introductions that accompany each volume further organize the material and provide readers with a working sense of the issues and the connection between articles.

**Computers The Machines We Think With** D. S. Halacy, 2024-03-18 Excerpt While you are reading this sentence, an electronic computer is performing 3 million mathematical operations. Before you read this page, another computer could translate it and several others into a foreign language. Electronic brains are taking over chores that include the calculation of everything from automobile parking fees to zero hour for space missile launchings. Despite bitter winter weather, a recent conference on computers drew some 4 000 delegates to Washington D C, indicating the importance and scope of the new industry. The 1962 domestic market for computers and associated equipment is estimated at just under 3 billion, with more than 150 000 people employed in manufacture, operation, and maintenance of the machines. In the short time since the first electronic computer made its appearance, these thinking machines have made such fantastic strides in so many different directions that most of us are unaware how much our lives are already being affected by them. Banking, for example, employs complex machines that process checks and handle accounts so much faster than human bookkeepers that they do more than an hour's work in less than thirty seconds.
