## **Software Change Impact Analysis:**

*Software Change Impact Analysis* Sunil Sikka,Ankit Dhamija,2020-05-19 Introducing changes in the software during development and post development is a very frequent activity Reasons for changes include client s changing requirements fixing leftover bugs and other security issues adding new functionality and so on Introducing changes in software may bring adverse effects that may degrade its quality or introduce new bugs which in turn will increase the software maintenance cost Therefore a systematic change management process is required A systematic process for managing software changes is already in place i e Change Impact Analysis CIA The current book conducts a systematic study of recent developments techniques and tools in the area of CIA

Change Request Impacts in Software Maintenance Madapuri Rudra Kumar,Kalli Srinivasa Nageswara Prasad,Annaluri Sreenivasa Rao,Vinit Kumar Gunjan,2020-08-06 This book discusses Change

Management Impact Analysis and how this method is used to analysis the risks and benefits of a change management initiative when it pertains to obtaining critical insight into how the change management program budget should be allotted

The process also offers useful indicators for what areas within the system should be monitored during the change management process This book presents theoretical analysis of practical implications and surveys along with analysis It covers the functions aimed at identifying various stakeholders associated with the software such as requirement component design component and class component The book talks about the interrelationship between the change and the effects on the rest of the system and dives deeper to include the critical role that the analysis places on the existing multiple functions such as estimating the development costs the project overhead costs cost for the modification of the system and system strength or detecting errors in the system during the process Case studies are also included to help researchers and practitioners to absorb the material presented This book is useful to graduate students researchers academicians institutions and professionals that interested in exploring the areas of Impact Analysis

Department of Computation,1998 **Software Change Impact Analysis** Shawn Bohner,Robert Arnold,1996-07-14 You will gain a healthy respect for the strengths and limitations of impact analysis technology and a solid background that will prove valuable for years to come The book identifies key impact analysis definitions and themes and illustrates the important themes to give you a solid understanding for tackling impact analysis problems

**A Change Impact Analysis Framework for the Software Development Phase** Nazri Mohd Kama,2011 Software undergoes changes at all stages of the software development process Accepting too many changes will cause expense and delay and rejecting the changes may cause customer dissatisfaction One of the inputs that help the software project management to decide whether to accept or reject the changes is by having reliable predictions of the impact of the changes Change impact analysis is one of the methods that can be used to provide the predictive information Many current

impact analysis techniques have been developed for the software maintenance phase. These techniques assume that all classes in the class artifact are completely developed and the class artifact is used as a source of analysis since it represents the final user requirements. However, these assumptions are not practical for impact analysis in the software development phase as some classes in the class artifact are still under development or partially developed. This leads to inaccuracy. This thesis presents a novel impact analysis framework to be used in the software development phase. The framework composes two main stages that are the development of the class interactions prediction and the impact analysis. The significant achievements of the framework are demonstrated through an extensive experimental validation using several case studies. The experimental analysis shows improvement in the accuracy over current impact analysis results.

**Software Change Impact Analysis for Java Code** Xiaozheng Ma, 2003

As software becomes increasingly complex, maintenance and evolution become more challenging to developers. One of the major problems for developers in an evolutionary environment is that seemingly small changes can ripple throughout the system and thus cause major unintended impact elsewhere. However, manual analysis is inefficient and error-prone for performing data dependency and impact analysis. There is a need for automatic tools to help software developers understand how changes in software system impact the rest of the system and identify those impacts. Although object-oriented codes are more easily packaged and have certain advantages, features such as encapsulation, inheritance, and polymorphism introduce new problems for analyzing ripple effects in object-oriented. This thesis presents a prototype of an automatic software change impact analyzer for Java code. Given the proposed changes such as the modification of fields, methods, or some statements inside a method, the goal of this automatic tool is to identify the possible impacts to the system based on data dependency analysis and present the impacts analysis results to the user. The output of the system is a set of affected classes, fields, and methods which can be used in cost estimation, change plan evaluation, efficient retesting, etc.

**Hybrid Change Impact Analysis Using Patterns of Change in Software History**

Sadjad Tavakoli, 2023

Change impact analysis is essential for predicting the impact of change in complex and dynamic applications. Balancing the precision and completeness of the analysis is challenging, especially for a highly dynamic programming language such as JavaScript. Existing impact analyses rely on techniques such as dynamic analysis and mining software repositories. Despite the benefits, dynamic analysis misses dependencies that are not exercised, and mining software repositories may yield imprecise results. In this paper, we propose a novel function-level hybrid impact analysis for JavaScript that utilizes the advantages of both techniques. For identifying the potential impact of a change set, our approach first extracts recurring patterns of change in software history that involve the change set. Next, it infers a dependency graph of the

software using dynamic analysis Integrating the findings of analyzing the patterns of change in software history with the dynamic code dependencies our proposed approach provides a ranked impact set We implement our approach in a tool named Caprese which we then evaluate using 10 open source Node js applications The results show that both dynamic analysis and frequent pattern detection units contribute uniquely to the approach We also demonstrate that Caprese outperforms a state of the art impact analysis tool by achieving 59% to 84% higher precision and 41% to 64% higher recall on average

**Impact Analysis** James Bruce Law,2005 Successful software systems evolve over their lifetimes through the cumulative changes made by software maintainers As software evolves the problems resulting from software change worsen exacerbated by increased system size and complexity lack of program understanding amount of effort required to make changes and number of personnel involved Experience shows that software changes made without visibility into their effects can lead to poor effort estimates delays in release schedules degraded software design unreliable software products increased costs and premature retirement of the software system Software change impact analysis impact analysis is a software maintenance technique meant to address these problems by assessing the effects of changes made to a software system While impact analysis is frequently cited as a motivation or a potential application for program analysis and software maintenance research research specific to the task of impact analysis has languished for more than 10 years In addition few researchers have examined the empirical factors underlying common impact analysis techniques or the tradeoffs inherent in known techniques and none have performed empirical studies comparing impact analysis techniques In this dissertation we introduce a new impact analysis approach named PathImpact that addresses a set of tradeoffs not addressed by any current impact analysis approach Ours is the first fully dynamic impact analysis approach PathImpact uses light weight instrumentation to record program execution at the level of procedure calls and returns then efficiently builds a compressed representation that can be directly used to estimate change impact We next extend PathImpact to accommodate system evolution yielding a technique we call EvolveImpact EvolveImpact updates the impact representation after a system change whereas PathImpact requires a complete recomputation In addition we show how our approaches can be extended to a large class of emerging software architectures including Java component based systems and large scale systems Finally we discuss the implementation of our approaches present the first cost models for impact analysis techniques and report the results of the first empirical studies that compare impact analysis techniques We also empirically examine the performance of our approaches and the factors affecting the use of our techniques in practice We found that our approach has linear time and space complexity in the size of the dynamic information collected and achieved a mean compression value of 0.955 on the subjects we used in our experiments Our investigation of program evolution across multiple versions of three of our subject programs showed that depending on the level of change activity EvolveImpact can update the impact representation more

efficiently than recomputing it in a majority of cases

### **Utilizing Change Impact Analysis for Improving Effort**

**Estimation in Agile Software Development** Binish Tanveer,2020-05-08 Effort estimation is used for planning and managing all phases of software development Traditional estimation methods rely on having a mostly complete and fixed specification of a system In agile software development cost and effort estimation is challenging as the requirements cannot be specified entirely upfront and are evolved as development progress and users interact with the product Current practice in this context relies heavily on human judgment which has several limitations It is based on limited information subjective opinion hampered by wishful thinking and prone to human judgment bias individual and group effects Estimates produced by these methods are often inaccurate Experts recognize the need and importance of more objective information that includes historical data from previous iterations Moreover current estimation methods do not objectively consider the potential impact of a change on existing software and custom factors that contribute to the effort overhead Thus considerable improvement potential exists concerning systematic effort estimation in this environment and marks the contribution of this research to the body of knowledge
