Solid State Devices 1983:

Solid State Devices, 1984 *Compound and Josephson High-Speed Devices* Takahiko Misugi, Akihiro Shibatomi, 2013-06-29 In recent years III V devices integrated circuits and superconducting integrated circuits have emerged as leading contenders for high frequency and ultrahigh speed applications GaAs MESFETs have been applied in microwave systems as low noise and high power amplifiers since the early 1970s replacing silicon devices The heterojunction high electron mobility transistor HEMT invented in 1980 has become a key component for satellite broadcasting receiver systems serving as the ultra low noise device at 12 GHz Furthermore the heterojunction bipolar transistor HBT has been considered as having the highest switching speed and cutoff frequency in the semiconductor device field Initially most of these devices were used for analog high frequency applications but there is also a strong need to develop high speed III V digital devices for computer telecom munication and instrumentation systems to replace silicon high speed devices because of the switching speed and power dissipation limitations of silicon The potential high speed and low power dissipation of digital integrated circuits using GaAs MESFET HEMT HBT and superconducting Josephson junction devices has evoked tremendous competition in the race to develop such technology A technology review shows that Japanese research institutes and companies have taken the lead in the development of these devices and some integrated circuits have already been applied to supercomputers in Japan The activities of Japanese research institutes and companies in the III V and superconducting device fields have been superior for three reasons First bulk crystal growth epitaxial growth process and design technology were developed at the same time **Solid State Devices 1983** E. H. Rhoderick, *Custom-Specific Integrated Circuits* Hurst, 1985-03-27 In the semiconductor industry cutting basic design time of microelectronics is by far the most cost effective measure for keeping production budgets in line Custom Specific Integrated Circuits thoroughly considers the various methods available to reduce the design time of a microelectronic circuit to fit a specialized requirement This important work explores the principles of both bipolar and MOS technologies and provides in depth coverage of the many avenues which enable system designers to incorporate specific needs into an integrated circuit form Comprehensive and up to date this reference compares and contrasts all the techniques of custom an semicustom design and fabrication including programmable arrays masterslice arrays cell libraries and full custom examines the principles of placement and routing of regular structures presents convenient chapter summaries for quick review of essential material and offers physics fundamentals for basic understanding while concentrating on practical system design Ideal for both the practicing engineer and graduate level engineering student this outstanding book gives electrical electronic design computer mechanical and control engineers as well as electrical electronic and computer science engineering students the contemporary hands on coverage needed to master Custom Specific Integrated Circuits Book jacket **Extended abstracts of the 15th Conference on Solid State Devices and Materials** Conference on Solid State Devices and Materials (15, 1983,
