Published in 1992 This book arose as a result of the authors work on the review Solitary Vortices in Plasmas written for the Soviet Journal of Plasma Physics With the development of nonlinear wave theory some novel concepts came into use such as solitary waves solitary vortices and solitons There is still some inconsistency in the use of these terms The study of solitary waves solitons should ultimately lead to a better understanding of the internal structure of elementary particles That is why solitons are attracting great attention from physicists and mathematicians The material presented in this book shows that solitons are also of interest in plasma physics and geophysics where these concepts have many important applications

Chian, 2007-08-17 As a star in the universe the Sun is constantly releasing energy over a wide range of time and spatial scales making energy into space as much as 10²⁶ erg/s. Its observations in the solar terrestrial environment, specifically energy emission, basically consists of three modes: Type I (solar flares), Type II (solar energetic particles), and Type III (solar coronal mass ejections). The understanding of these processes is crucial for the study of solar energy. The first mode of solar energy is the so-called blackbody radiation. In the early days, the phenomena in each plasma diation were commonly known as sunlight and the second region were studied separately but with the progress of solar electromagnetic emission such as X rays of research, we realized the importance of treating them together. UV radiation is mostly absorbed above the Earth's atmosphere, so the whole chain of processes as an entity because of the stratosphere. The third mode of solar energy emission is strong interactions between various regions within the solar system, in the form of particles having a wide range of energies. The solar terrestrial system on the basis of extensive research from less than keV to more than GeV. It is convenient to use satellite observations and computer simulations to group these particles into lower energy particles and the past two decades, it has become possible to analyze higher energy particles which are referred to as the so-called solar wind. The close coupling of different regions in the solar wind and solar cosmic rays respectively, is the key to understanding the solar terrestrial environment.
