challenging issue for both experimentalists and theoreticians 1D 2D and 3D structures are obtained using a variety of techniques Depending on the application nanoparticle based films are required to be dense porous or grainy Obtaining and controlling nanoparticle assembly is difficult due to contributions from numerous interparticle and nanoparticle substrate forces with relatively similar amplitudes Besides size distribution and concentration energy input temperature and pressure during deposition are three important parameters used to control film characteristics Self assembling monolayer spray Langmuir Blodgett layer by layer electrophoretic deposition and evaporation driven self assembly are simple and scalable techniques Depending on the application requirements numerous other integration methods are available Templating dip coating tape casting inkjet printing screen printing and electrostatic self assembly have been used in commercial and pre commercial solutions The majority of these techniques do not require high capital cost and are quite easily amenable to roll to roll processes Mechanical consolidation techniques are used to produce directly integrated nanoparticle based material structures
