Telecommunication Systems Engineering [by] William C. Lindsey [and]

Marvin K. Simon William C. Lindsey,1973 **Voice Teletraffic Systems Engineering** James R. Boucher,1988

Telecommunications Engineering J. Dunlop,D. G. Smith,1994-01-01 Telecommunication engineering is concerned with the transmission of information between two distant points Intuitively we may say that a signal contains information if it tells us something we did not already know This definition is too imprecise for telecommunications studies and we shall devote a section of this chapter to a formal description of information For the present it is sufficient to say that a signal that contains information varies in an unpredictable or random manner We have thus specified a primary characteristic of the signals in telecommunications systems they are random in nature These random signals can be broadly subdivided into discrete signals that have a fixed number of possible values and continuous signals that have any value between given limits Whichever type of signal we deal with the telecommunication system that it uses can be represented by the generalized model of Fig 1.1 The central feature of this model is the transmission medium or channel Some examples of channels are coaxial cables radio links optical fibres and ultrasonic transmission through solids and liquids It is clear from these examples that the characteristics of channels can vary widely The common feature of all channels however is that they modify or distort the waveform of the transmitted signal In some cases the distortion can be so severe that the signal becomes totally unrecognizable In many instances it is possible to minimize distortion by careful choice of the transmitted signal waveform

Satellite Communication Systems Engineering Wilbur L. Pritchard,Henri G. Suyderhoud,Robert A. Nelson,1993 Detailing concepts and calculations from the entire field this text is sophisticated enough to permit the kinds of analysis needed for major systems planning decisions while it avoids the highly theoretical work found in the literature on special disciplines This second edition covers channel capacity picture quality signal to noise ration bit error rate earth station antenna size and offers new material on orbital mechanics and geometry For satellite communications systems engineers
