### **Splitting Extrapolation Method, the: A New Technique In Numerical Solution Of Multidimensional Prob C B**

Liem, Tsimin Shih, 1995-09-30 The splitting extrapolation method is a newly developed technique for solving multidimensional mathematical problems. It overcomes the difficulties arising from Richardson's extrapolation when applied to these problems and obtains higher accuracy solutions with lower cost and a high degree of parallelism. The method is particularly suitable for solving large scale scientific and engineering problems. This book presents applications of the method to multidimensional integration, integral equations, and partial differential equations. It also gives an introduction to combination methods which are relevant to splitting extrapolation. The book is intended for those who may exploit these methods and it requires only a basic knowledge of numerical analysis.

*Iterative Splitting Methods for Differential Equations* Juergen Geiser, 2011-06-01  
*Iterative Splitting Methods for Differential Equations* explains how to solve evolution equations via novel iterative based splitting methods that efficiently use computational and memory resources. It focuses on systems of parabolic and hyperbolic equations including convection diffusion reaction equations, heat equations, and wave equations. In the theoretical part of the book, the author discusses the main theorems and results of the stability and consistency analysis for ordinary differential equations. He then presents extensions of the iterative splitting methods to partial differential equations and spatial and time dependent differential equations. The practical part of the text applies the methods to benchmark and real life problems such as waste disposal, elastics, wave propagation, and complex flow phenomena. The book also examines the benefits of equation decomposition. It concludes with a discussion on several useful software packages including r3t and FIDOS. Covering a wide range of theoretical and practical issues in multiphysics and multiscale problems, this book explores the benefits of using iterative splitting schemes to solve physical problems. It illustrates how iterative operator splitting methods are excellent decomposition methods for obtaining higher order accuracy.

#### **Environmental Models: Needs and Availability**

István Faragó, Ágnes Havasi, Zahari Zlatev, 2013-12-10 High air pollution levels pose a significant threat to plants, animals, and human beings. Efforts by researchers are directed towards keeping air pollution levels below well defined critical levels in order to maintain a sustainable atmosphere and environmental system. The application of advanced mathematical models is important for researchers to achieve this goal as efficiently as possible. Mathematical models can be used to predict answers to many important questions about the environment. This application comes with several complex theoretical and practical obstacles which need to be resolved. A successfully applicable mathematical model needs to enable researchers to mathematically describe all important physical and chemical processes. Apply fast and sufficiently accurate numerical methods. Ensure that the model runs efficiently on modern high speed computers. Use high quality input data, both meteorological data and emission inventories, in the runs. Verify the model results by comparing them with reliable measurements taken in different parts of the spatial domain of the model. Carry out long

series of sensitivity experiments to check the response of the model to changes of different key parameters Visualize and animate the output results in order to make them easily understandable even to non specialists This monograph thoroughly describes mathematical methods useful for various situations in environmental modeling including finite difference methods splitting methods parallel computation etc and provides a framework for resolving problems posed in relation to the points listed above Chapters are written by well known specialists making this book a handy reference for researchers university teachers and students working and studying in the areas of air pollution meteorology applied mathematics and computer science

Parallel Multilevel Methods Gerhard Zumbusch,2012-12-06 Numerical simulation promises new insight in science and engineering In addition to the traditional ways to perform research in science that is laboratory experiments and theoretical work a third way is being established numerical simulation It is based on both mathematical models and experiments conducted on a computer The discipline of scientific computing combines all aspects of numerical simulation The typical approach in scientific computing includes modelling numerics and simulation see Figure 1 Quite a lot of phenomena in science and engineering can be modelled by partial differential equations PDEs In order to produce accurate results complex models and high resolution simulations are needed While it is easy to increase the precision of a simulation the computational cost of doing so is often prohibitive Highly efficient simulation methods are needed to overcome this problem This includes three building blocks for computational efficiency discretisation solver and computer Adaptive mesh refinement high order and sparse grid methods lead to discretisations of partial differential equations with a low number of degrees of freedom Multilevel iterative solvers decrease the amount of work per degree of freedom for the solution of discretised equation systems Massively parallel computers increase the computational power available for a single simulation
