### **Individual Susceptibility to Genotoxic Agents in the Human Population** Frederick J. De Serres, Ronald W.

Pero, William Sheridan, 2012-12-06 As a result of the industrial revolution man's technological achievements have been truly great increasing the quality of life to almost unimaginable proportions but all this progress has not been accomplished without equally unimaginable health risks. Sufficiently diagnostic short term assay procedures have been developed in recent years for us to determine that there are mutagenic agents among thousands of chemicals to which the human population is exposed today. These chemicals were not significantly present prior to the industrial revolution. As of today there are no procedures available which have been adequately demonstrated to assess individual susceptibility to genotoxic exposures and as a result we have had to rely on extrapolating toxicological data from animal model systems. The question is can we afford to allow such an increased environmental selection pressure via mutagenic exposures to occur without expecting adverse long term effects on our health. It is apparent from this line of reasoning that what is lacking and immediately needed are test procedures that can be applied to humans to assess genotoxic exposure as well as individual susceptibility to it. There have already been two conferences which have focused attention on this research area. Guidelines for studies of human populations exposed to mutagenic and reproductive hazards. A. D. Bloom, ed. March of Dimes Birth Defects Foundation White Plains New York 1981 and Indicators of genotoxic exposure in humans Banbury Report 13 B. A. Bridges B. E. Butterworth and I. B. *Human Population Biology* Michael A. Little, Jere D. Haas, 1989. This book is a careful integration of the social and biological sciences drawing on anthropology biology human ecology and medicine to provide a comprehensive understanding of how our species adapts to natural and man made environments. Part I presents techniques to adapt and apply demographic methods to small populations particularly important for studying non Western populations. Part II discusses the relationship of medical genetics to human adaptability and patterns of disease in non Western populations. Part III covers capacity climatic stress and nutrition. Part IV presents methods for growth assessment and prediction and addresses the topic of aging. The final section Part V presents integrated case studies of human adaptation to high altitude and patterns of modernization and stress resulting from cultural change. *The Human Population*, 1974. The growth rate of the populations of the industrialized nations is approaching zero as both birth and death rates decline. Accompanying this transition has been as radical a change in the nature of the family and of the role of women. These changes constitute a kind of biological revolution a consequence of that other revolution the industrial. In the underdeveloped countries zero population growth seems an almost impossible goal. Some underdeveloped countries have population doubling times of less than 25 years owing to an improved medical technology that is reducing death rates while having little effect on fertility. Still there are reasons to believe that this explosive growth an anomaly in the history of our species is only an early stage in the transition to an industrial economy a higher material standard of living and eventually a much lower rate of population growth. Whatever happens it seems certain

that before zero growth is attained the world's population will have at least doubled eight billion human beings is a conservative estimate of the total. Zero or near zero growth will come but the important questions are when and how. The speed with which the industrial revolution comes to the underdeveloped countries will determine whether growth will be stemmed by a high death rate, starvation or by a low birth rate. This collection of articles from *Scientific American* gives a comprehensive view of the demographic problems facing humanity today. Abundantly illustrated and clearly written. *The Human Population* is essential supplementary reading for all courses dealing with these problems. In regard to the human population people have been asking this question for centuries. The current world population is approaching seven billion people. At the current 1.2 per cent rate of annual increase the population will reach a whopping 9.5 billion people by 2050. *The Human Population* explores whether this statistical information is cause for alarm, examining the issues of feeding such a population, sustaining natural resources, having enough living space and other necessities for a comfortable life on Earth. Is the world suffering from a terrible population explosion or is life getting better for most people despite a growing population? These are some of the questions and issues covered in the pages of this fascinating, timely new book.      **Lippincott's Gazetteer of the World**, 1880      The Book of Genesis Marcus Dods, 1899      **The Human Population** *Scientific American*, 1974      *The Oölogist*, 1888
