Mathematical Methods for the

Magnetohydrodynamics of Liquid Metals Jean-Frédéric Gerbeau,Claude Le Bris,Tony Lelièvre,2006-08-31 This comprehensive text focuses on mathematical and numerical techniques for the simulation of magnetohydrodynamic phenomena with an emphasis laid on the magnetohydrodynamics of liquid metals and on a prototypical industrial application Aimed at research mathematicians engineers and physicists as well as those working in industry and starting from a good understanding of the physics at play the approach is a highly mathematical one based on the rigorous analysis of the equations at hand and a solid numerical analysis to found the simulations At each stage of the exposition examples of numerical simulations are provided first on academic test cases to illustrate the approach next on benchmarks well documented in the professional literature and finally whenever possible on real industrial cases

Finite Element and

Discontinuous Galerkin Methods for Transient Wave Equations Gary Cohen,Sébastien Pernet,2016-08-05 This monograph presents numerical methods for solving transient wave equations i e in time domain More precisely it provides an overview of continuous and discontinuous finite element methods for these equations including their implementation in physical models an extensive description of 2D and 3D elements with different shapes such as prisms or pyramids an analysis of the accuracy of the methods and the study of the Maxwell s system and the important problem of its spurious free approximations After recalling the classical models i e acoustics linear elastodynamics and electromagnetism and their variational formulations the authors present a wide variety of finite elements of different shapes useful for the numerical resolution of wave equations Then they focus on the construction of efficient continuous and discontinuous Galerkin methods and study their accuracy by plane wave techniques and a priori error estimates A chapter is devoted to the Maxwell s system and the important problem of its spurious free approximations Treatment of unbounded domains by Absorbing Boundary Conditions ABC and Perfectly Matched Layers PML is described and analyzed in a separate chapter The two last chapters deal with time approximation including local time stepping and with the study of some complex models i e acoustics in flow gravity waves and vibrating thin plates Throughout emphasis is put on the accuracy and computational efficiency of the methods with attention brought to their practical aspects This monograph also covers in details the theoretical foundations and numerical analysis of these methods As a result this monograph will be of interest to practitioners researchers engineers and graduate students involved in the numerical simulationof waves

S. Hesthaven, 2001 We present an ab initio development of a convergent high order accurate scheme for the solution of linear conservation laws in geometrically complex domains As our main example we present a detailed development and analysis of a scheme suitable for the time domain solution of Maxwell s equations in a three dimensional domain The fully unstructured spatial discretization is made possible by the use of high order nodal basis employing multivariate Lagrange polynomials defined on the triangles and tetrahedra Careful choices of the unstructured nodal grid points ensure high order spectral accuracy while the equations themselves are satisfied in a discontinuous Galerkin form with the boundary conditions being enforced weakly through a penalty term Accuracy stability and convergence of the semi discrete approximation to Maxwell s equations is established rigorously and bounds on the global divergence error are provided Concerns related to efficient implementations are discussed in detail This sets the stage for the presentation of examples verifying the theoretical results as well as illustrating the versatility flexibility and robustness when solving two and three dimensional benchmarks in computational electromagnetic Pure scattering as well as penetration is discussed and high parallel performance of the scheme is demonstrated [Development of K-version of the Finite Element Method](#) Junuthula Narasimha Reddy, 2006 This report summarizes the research carried out under Grant F49620 03 1 0201 on the development of least squares based finite element models of viscous compressible and incompressible flows as well as shear deformable plates and shells The main objective of this research was to develop a robust and accurate computational methodology based on least squares variational principles for the numerical solution of the equations governing plates and shells and viscous incompressible and compressible fluid flows The use of least squares principles leads to a variationally unconstrained minimization problem where compatibility conditions between approximation spaces such as

inf sup conditions never arise Furthermore the resulting linear algebraic problem will always have a symmetric positive definite SPD coefficient matrix allowing the use of robust and fast preconditioned conjugate gradient methods for its solution In this research the basic theory of least squares finite element formulations of the equations governing viscous incompressible flows and shear deformable theories of plate and shell structures was carried out and their application through a variety of benchmark problems was illustrated In the case of fluid flows penalty least squares finite element models using high p levels and low penalty parameters were developed as a good alternative to mixed least squares finite element models also developed in the research **Parallel Multi-scale Algorithms and Applications to Turbulence**

George E. Karniadakis,1997 This report describes development of a new hierarchical spectral basis appropriate for hp finite element formulations on unstructured grids consisting of triangular and tetrahedral subdomains The new multi resolution basis has the following properties 1 Jacobi polynomials of mixed weights 2 Semi orthogonality leading to great sparsity 3 Hierarchical structure 4 Generalized tensor products 5 Mixed order expansions which provides great flexibility in adaptive discretizations and 6 Gauss Jacobi quadratures that minimize errors in complicated geometries The accuracy of this method has been tested in two and three dimensions Importantly numerical results verified that the new hierarchical basis exhibits convergence even for highly distorted meshes **Advanced Computational Methods in Heat Transfer VIII** Bengt Sundén,C.
