[Methods in Cellular Imaging](#) Ammasi Periasamy,2013-05-27 Advances in technology have revolutionized the development of light microscopy techniques in biomedical research thus improving visualization of the microstructure of cells and tissues under physiological conditions Fluorescence microscopy methods are non contact and non invasive and provide high spatial

and temporal resolution that other laboratory techniques cannot. This well illustrated book targets graduate students and scientists who are new to the state of the art fluorescence microscopy techniques used in biological and clinical imaging. It explains basic concepts and imaging procedures for wide field, confocal, multiphoton excitation, fluorescence resonance energy transfer, FRET, lifetime imaging, FLIM, spectral imaging, fluorescence recovery after photobleaching, FRAP, optical tweezers, total internal reflection, high spatial resolution, atomic force microscopy, AFM, and bioluminescence imaging for gene expression. The usage of these techniques in various biological applications including calcium, pH, membrane potential, mitochondrial signaling, protein-protein interactions under various physiological conditions and deep tissue imaging is clearly presented. The authors describe the approaches to selecting epifluorescence microscopy, the detectors and the image acquisition and processing software for different biological applications. Step by step directions on preparing different digital formats for light microscopy images on websites are also provided.

Hopkinson, [Anonymus AC01401231], 1995 Optical Radiometry and Satellite Validation Agnieszka Bialek, David Doxaran, Vittorio Ernesto Brando, Clemence Goyens, Kevin Ruddick, Ana Ines Dogliotti, 2025-08-26 Strict quality control is essential to ensure that the satellite data products routinely used for environmental monitoring of water and land surfaces are fit for purpose. A crucial step in this process is the validation of the water and land surface reflectances from which the final end user products are derived. The topic of radiometric validation is growing rapidly in importance both because of the advent of operational satellite missions for routine environmental monitoring and because of the rapid expansion in the number of satellite missions including CubeSat constellations with limited cal/val resources. This enhanced need for radiometric validation data covering a wide VIS/NIR/SWIR range e.g. 380-2400 nm, preferably with a hyperspectral resolution, must be met by new techniques and hardware, particularly ground-based automated radiometry.
