Brain Informatics (BI) has emerged as an interdisciplinary research field that focuses on studying the mechanisms underlying the human information processing system. HIPS (Human Information Processing System) It investigates the essential functions of the brain ranging from perception to thinking and encompassing such areas as multi-perception, attention, memory, language, computation, heuristic search, reasoning, planning, decision making, problem solving, learning, discovery, and creativity. The goal of BI is to develop and demonstrate a systematic approach to achieving an integrated understanding of both macroscopic and microscopic level working principles of the brain by means of experimental, computational, and cognitive neuroscience studies, as well as utilizing advanced Web Intelligence (WI)-centric information technologies. BI represents a potentially revolutionary shift in the way that research is undertaken. It attempts to capture new forms of collaborative and interdisciplinary work. Following this vision, new kinds of BI methods and global research communities will emerge through infrastructure on the wisdom Web and knowledge grids that enables high speed and distributed large-scale analysis and computations and radically new ways of sharing data and knowledge.
