**The Biohistory of Feminism** Carol Blakney, Abel Alves, 2026-02-02 The Biohistory of Feminism is a multilayered project that incorporates evolutionary biology to argue that behaviors labelled feminist by human cultures are already found in nature and that there is no one path to being female. On a planet where asexual reproduction dominates intersex and parthenogenesis exist and eusocial females contribute to their colonies without reproducing, being female goes beyond motherhood stereotypes dear to those who attempt to perpetuate a universal idea of male dominance in human history. Feminism exists naturally as a series of efforts to express oneself in a multiplicity of ways freely chosen including the attainment of alpha status as a social animal managing resources and forming alliances. Elephant matriarchs and alpha female bonobos were there among social animals before the appearance of human monarchs like Wu Zetian and contemporary politicians like Angela Merkel and cultural leaders like Wangari Maathai. Female dolphins and chimpanzees taught cultural traditions before the intellectual achievements of literary figures like Sor Juana Inés de la Cruz and scientists like Jane Goodall. The diversity of female expression in nature is natural.

Systemic Approaches in Bioinformatics and Computational Systems Biology: Recent Advances Lecca, Paola, Tulpan, Dan, Rajaraman, Kanagasabai, 2011-12-31 The convergence of biology and computer science was initially motivated by the need to organize and process a growing number of biological observations resulting from rapid advances in experimental techniques. Today, however, close collaboration between biologists, biochemists, medical researchers, and computer scientists has also generated remarkable benefits for the field of computer science. Systemic Approaches in Bioinformatics and Computational Systems Biology: Recent Advances presents new techniques that have resulted from the application of computer science methods to the organization and interpretation of biological data. The book covers three subject areas: bioinformatics, computational biology, and computational systems biology. It focuses on recent systemic approaches in computer science and mathematics that have been used to model, simulate, and more generally experiment with biological phenomena at any scale.
