Coding and Iterative Detection for Magnetic Recording Channels Zining Wu, 2000-01-31 The advent of the internet age has produced enormous demand for increased storage capacity and for the consequent increases in the amount of information that can be stored in a small space While physical and media improvements have driven the majority of improvement in modern storage systems signal processing and coding methods have increasingly been used to augment those improvements Run length limited codes and partial response detection methods have come to be the norm in an industry that once rejected any sophistication in the read or write processing circuits VLSI advances now enable increasingly sophisticated signal processing methods for negligible cost and complexity a trend sure to continue even as disk access speeds progress to billions of bits per second and terabits per square inch in the new millennium of the information age This new book representing the Ph D dissertation work of Stanford's recent graduate Dr Zining Wu is an up to date and focused review of the area that should be of value to those just starting in this area and as well those with considerable expertise The use of saturation recording i e the mandated restriction of two level inputs creates interesting twists on the use of communication transmission methods in recording

Truncated abstract The transmission of digital information over a wireless communication channel gives rise to a number of issues which can detract from the system performance Propagation effects such as multipath fading and intersymbol interference ISI can result in significant performance degradation Recent developments in the field of iterative detection have led to a number of powerful strategies that can be effective in mitigating the detrimental effects of wireless channels In this thesis iterative detection is considered for use in two distinct areas of wireless communications The first considers the iterative decoding of concatenated block codes over slow flat fading wireless channels while the second considers the problem of detection for a coded communications system transmitting over highly dispersive frequency selective wireless channels The iterative decoding of concatenated codes over slow flat fading channels with coherent signalling requires

knowledge of the fading amplitudes known as the channel state information CSI. The CSI is combined with statistical knowledge of the channel to form channel reliability metrics for use in the iterative decoding algorithm. When the CSI is unknown to the receiver, the existing literature suggests the use of simple approximations to the channel reliability metric. However, these works generally consider low rate concatenated codes with strong error correcting capabilities. In some situations, the error correcting capability of the channel code must be traded for other requirements such as higher spectral efficiency, lower end-to-end latency, and lower hardware cost. In particular, when the error correcting capabilities of the concatenated code are weak, the conventional metrics are observed to fail, whereas the proposed metrics are shown to perform well regardless of the error correcting capabilities of the code. The effects of ISI caused by a frequency selective wireless channel environment can also be mitigated using iterative detection. When the channel can be viewed as a finite impulse response (FIR) filter, the state-of-the-art iterative receiver is the maximum a posteriori probability (MAP) based turbo equaliser. However, the complexity of this receiver's MAP equaliser increases exponentially with the length of the FIR channel. Consequently, this scheme is restricted for use in systems where the channel length is relatively short. In this thesis, the use of a channel shortening prefilter in conjunction with the MAP based turbo equaliser is considered in order to allow its use with arbitrarily long channels. The prefilter shortens the effective channel, thereby reducing the number of equaliser states. A consequence of channel shortening is that residual ISI appears at the input to the turbo equaliser, and the noise becomes coloured. In order to account for the ensuing performance loss, two simple enhancements to the scheme are proposed. The first is a feedback path which is used to cancel residual ISI based on decisions from past iterations. The second is the use of a carefully selected value for the variance of the noise assumed by the MAP based turbo equaliser. Simulations are performed over a number of highly dispersive channels, and it is shown that the proposed enhancements result in considerable performance improvements. Moreover, these performance benefits are achieved with very little additional complexity with respect to the unmodified channel shortened turbo equaliser.

businesses more competitive efficient and productive Entire organizations have been radically restructured thanks to the fact that IE and CASE now make information directly accessible throughout an organization without being distilled through multiple layers of management But good intentions and dollars spent are no guarantee of success and any technology old or new is only as good as the managers who manage it and the staff who uses it Information systems rarely fail because of technical inadequacies Usually the failure stems from a lack of staff expertise in how to apply the basic concepts and principles of new technologies to the unique organizational milieu Information Engineering was designed to assist managers and information workers in high tech companies to successfully integrate and maintain computer aided software programs into their organization s engineering information system It provides step by step guidance to the assessment of a company s specific needs and to the implementation of systems tailored to the company s business goals And it describes how commercially available CASE packages can be successfully combined with engineering systems developed in house By following the proven training techniques found in this book managers will quickly develop staffs fully versed in planning designing analyzing and constructing integrated information systems that support complex manufacturing and supply operations or any high tech business that relies heavily upon the rapid information exchange of complex technical information
