

# NATURE VS NURTURE

Nature versus nurture is an ongoing debate about the degree to which human behaviour is determined by genetic inheritance (nature) or learned through interactions with the environment (nurture).

## NURTURE

Empiricists suggest behaviour is determined by the environment and personal experiences. They believe all human characteristics are a result of social and natural environmental forces that influence development from birth onwards.

**John B. Watson (1903)** conducted a case study on a child known as 'Little Albert' to see if it was possible to condition a child to fear a previously un-fearful object.

- Little Albert showed no fear response to any stimuli before the experiment.
- Little Albert was presented with a white rat. Each time he reached for it, a steel bar was hit. After seven repetitions, Albert reacted to the rat alone crying and quickly crawling away, without the bar being hit.
- The fear had been transferred to similar looking objects, including a rabbit and a fur coat.
- One month later, Albert continued to show fear reactions to all similar objects. This provided evidence that the environment can be manipulated to create a phobic response and behavioural change.

**Zimbardo (1973)** conducted the **Stanford Prison Experiment** to investigate the effect that roles and the environment can have on people's behaviour.

- 24 male students were randomly assigned to the role of 'prisoner' or 'guard'.
- A simulated prison was built in the basement of the psychology building at Stanford University.
- Guards were issued with uniforms, batons, whistles and handcuffs as symbols of control and power.
- As students settled into their roles, their behaviour was affected. Guards became aggressive and abusive. Prisoners became increasingly depressed and several experienced acute anxiety and the early stages of deep depression.
- The experiment had to be stopped after just six days.

**The Humanistic Approach** – explains how people's behaviour is influenced by their perception and understanding of the world.

**The Behaviourist Approach** – believes all behaviour is learned through a process of conditioning.

**The Social Approach** – explains how people's behaviour is influenced by the presence of others.

## PROBLEMS WITH THE NATURE VS NURTURE DEBATE

1. It is reductionist because it states that behaviour is solely caused by genetic factors or experience.
2. It is deterministic because nativists suggest that behaviour is determined by hereditary factors, and empiricists suggest that behaviour is the result of interactions with the environment.
3. It is difficult to control variables. For example, the similarities in twin studies could relate to how the twins were raised. All nurture influences cannot be listed.

## NATURE

Nativists suggest that behaviour is caused by innate characteristics that are inherited from our ancestors and form our genetic make-up. They believe genes programme all of our behaviours: some are present from birth, and others behaviour are pre-programmed to emerge in later life.

**Gottesman and Shields (1976)** reviewed twin and adoption studies to determine whether schizophrenia has a genetic link.

**Adoption studies** found an increased occurrence of schizophrenia in adopted children with a schizophrenic biological parent. Children fostered to schizophrenic parents and adoptive parents of schizophrenic children showed little evidence of schizophrenia. This indicates a significant genetic input into the onset of schizophrenia.

**Twin studies** found a higher concordance rate for schizophrenia in identical twins than non-identical twins. (A concordance rate is the probability that both individuals in a pair will have a certain characteristic given that one of the pair has that characteristic.) Importantly, there was a concordance rate of 58% in identical twins compared to 12% in non-identical twins.

**Plomin (1986)** found that the overall heritability of IQ in identical and non-identical twins was about 0.58, which means 58% of IQ was influenced by genetics. When only identical twins that lived apart were studied, the concordance rate increased to 0.74, which means they were 74% similar despite living in different environments. Genetic influence appears to be stronger than environmental influence.

**The Biological Approach** – explains behaviour in relation to the functioning of the brain and nervous systems.

## NATURE AND NURTURE INTERACTION

Psychologists generally agree that behaviour is a result of the interaction between nature and nurture.

People may contribute to their own environments.

An individual's characteristics may cause people to respond to both or less in a particular way. In turn, this may influence the individual's behaviour, emotions, and beliefs.

**Maguire et al. (2006)** conducted a study of taxi drivers and found that the structure of the brain can change as a result of environmental demands.

They studied structural MRI scans in a group of London taxi drivers to see if the hippocampus would change because of their high dependence on navigation skills. The posterior hippocampus, which stores a spatial representation of the environment, was larger in taxi drivers than in control participants who did not drive taxis. This indicates that the posterior hippocampus can expand significantly in people with high dependence on navigational skills.

Genes can be seen as setting the upper and lower limits for people's behaviour.

The environmental may determine where an individual's behaviour falls within these limits.

Hippocampus

**The Psychodynamic Approach** – takes both environmental and genetic factors into account. Freud claimed personality is the product of innate drives and childhood experiences.

**The Cognitive Approach** – focuses on the brain's cognitive abilities but recognises that behaviour is influenced by experiences.

**The Developmental Approach** – recognises the importance of both nature and nurture in behavioural development.

as a weapon and how issues related to religion and gender contribute to violent conflict      *Mind Shift* John

Parrington, 2021-04-22 John Parrington argues that social interaction and culture have deeply shaped the exceptional nature of human consciousness. The mental capacities of the human mind far outstrip those of other animals. Our imaginations and creativity have produced art, music, and literature. Built bridges and cathedrals enabled us to probe distant galaxies and to ponder the meaning of our existence. When our minds become disordered, they can also take us to the depths of despair. What makes the human brain unique and able to generate such a rich mental life? In this book, John Parrington draws on the latest research on the human brain to show how it differs strikingly from those of other animals in its structure and function at a molecular and cellular level. And he argues that this shift, enlarging the brain, giving it greater flexibility and enabling higher functions such as imagination, was driven by tool use but especially by the development of one remarkable tool: language. The complex social interaction brought by language opened up the possibility of shared conceptual worlds enriched with rhythmic sounds and images that could be drawn on cave walls. This transformation enabled modern humans to leap rapidly beyond all other species and generated an exceptional human consciousness, a sense of self that arises as a product of our brain biology and the social interactions we experience. Our minds, even those of identical twins, are unique because they are the result of this extraordinarily plastic brain, exquisitely shaped and tuned by the social and cultural environment in which we grew up and to which we continue to respond through life. Linking early work by the Russian psychologist Lev Vygotsky to the findings of modern neuroscience, Parrington explores how language, culture, and society mediate brain function and what this view of the human mind may bring to our understanding and treatment of mental illness.      *Psychology and the Challenges of Life*

Jeffrey S. Nevid, Spencer A. Rathus, 2009-11-23 A long respected standard in the psychology of adjustment, *Psychology and the Challenges of Life*, Eleventh Edition, has been thoroughly updated and contemporized to provide students the ability to reflect on how psychology relates to the lives we live and the roles that psychology can play in helping us with the challenges we face. Authors Jeffrey Nevid and Spencer Rathus explore the many applications of psychological concepts and principles used to meet the challenges of daily life while encouraging students to apply concepts to themselves through active learning exercises, self-assessment questionnaires, and journaling exercises.      **Encyclopedia of Infant and Early Childhood**

**Development** Marshall M. Haith, Janette B. Benson, 2008-02-19 Infancy is a unique period in that at no other state is there greater growth and development. During this time, growth is occurring at a physical level, but equally impressive are the socio-emotional and cognitive developments during this time. Genetics, the womb environment, and the physical environment after birth all combine to impact the rate and manner of growth. Who we ultimately become as individuals begins here. Intended for university and public libraries, the *Encyclopedia of Infant and Early Childhood Development* is the major reference work that provides a comprehensive entry point into all of the existing literature on child development from the fields of psychology, genetics, neuroscience, and sociology. The scope of this work is to understand the developmental changes when they occur.
