Introduction

The origins and development of the scientific and technical press can be traced back to 1665 when the first "modern" scientific papers appeared and were characterized by non-standardised form and style¹. Subsequently, nearly 300 years ago², in an attempt to ensure that articles met the journal's standards of quality and scientific validity, the peer-reviewed process for scientific manuscripts was born in England and France. Since then, there has been an enormous proliferation of scientific journals and manuscripts so that, at present, the numbers of biomedical papers published annually by over 20,000 journals, at a rate of 5,500 new papers per day, far exceeds 2,000,000^{3,4}.

Published scientific papers and professional meetings are really essential to disseminate relevant information and research findings. However, most of the abstracts of presentations given at scientific meetings are usually available only in conference proceedings although they have the potential to be subsequently published as articles in peer-reviewed journals.

A recently published Cochrane review showed that only 44.5% of almost 30,000 scientific meeting abstracts were published as articles⁵. No association between full publication and authors' country of origin was detected. Factors associated with full publication included acceptance/rejection of abstracts for oral or poster presentations, acceptance for oral presentations rather than poster sessions, "positive" results, using the report authors' definition of "positive", randomised trial study design and basic rather than clinical research.

Possible reasons for failed publication include lack of time, research still underway, problems with co-authors and negative results⁶. Undoubtedly, lack of the necessary skills and experience in the process of writing and publishing is another possible contributing factor also in the field of Transfusion Medicine although the specialists in this discipline are currently adopting the principles and research methodologies that support evidence-based medicine⁷, and high-level research is actually being carried out at the same rate as in all medical specialties.

There are three broad groups of manuscripts: original scientific articles, reviews and case reports. Although case reports are part of the evidence hierarchy in evidence-based practice, albeit at a lower level, and case series are incorporated in a significant proportion of health technology assessments⁸, this article will address the multiple steps required in writing original articles and reviews with the aim of providing the reader with the necessary tools to prepare, submit and successfully publish a manuscript.

The anatomy of a paper: from origin to current format

The history of scientific journals dates from 1665, when the French "Journal des savants" and the English "Philosophical Transactions of the Royal Society" first began systematically publishing research results⁹. From then on, the initial structure of scientific papers evolved gradually from letters (usually by a single author, with a polite style and contemporarily addressing multiple subjects) and experimental reports (essentially descriptive and presenting experiences and effects in chronological order) to a better structured and more fluent form characterised by an embryonic description of methods and interpretation of results. This evolved way of reporting experiments gradually replaced the letter form.

It was not, however, until the second half of the 19th century that the method description became fully developed and a comprehensive organisation of the manuscripts known as "theory-experiment-discussion" emerged¹⁰. At the beginning of the last century a gradual decrease of the use of the literary style coincided with a growing standardisation of the editorial rules that paved the way for the formal established Introduction, Methods, Results, and Discussion (IMRAD) structure of scientific papers, which was adopted in the 1980s.

At present, IMRAD is the format encouraged for the text of observational (i.e. retrospective/descriptive) and experimental (i.e. randomised controlled) studies by the "Uniform Requirements for Manuscripts Submitted to Biomedical Journals" which have become the most important and widely accepted (by over 500

Reviewing Qualitative Research in

the Social Sciences Audrey Trainor,Elizabeth Graue,2013 Foundational characteristics of qualitative research include flexibility variation in application critique and innovation all of which derive from its subjective roots in interpretivism and constructivism While the scholars who design qualitative research projects envision these qualities as strengths such a breadth of practices and the assumptions that undergird them may present challenges during the peer review process As a result those who review and consume qualitative research often have important and difficult to answer questions about the project's design strategies tools and analysis with few guidelines for gauging the merit of the work The mission of this book is to provide a useful guide for researchers reviewers and consumers who are charged with judging the quality of qualitative studies In order to embrace the challenges and controversies that accompany this goal the editors have solicited experts representing multiple disciplines and methods of qualitative inquiry Their contributions represent the rich diversity in the field while simultaneously producing a pragmatic and useful guide While it is neither possible nor desirable to compartmentalize qualitative approaches and issues into neatly organized categories the construct of method has been

chosen as a common organizing device The introductory chapter explains the need for such a book and underscores the foundational strengths of qualitative research flexibility variation critique and innovation The remaining chapters review the principal approaches to qualitative research with care taken not to standardize rigidly define or oversimplify any approach For ease of use all methodological chapters are organized around the following elements of inquiry which reviewers tend to examine definition sampling data collection data analysis representation and congruency *NTA NET Previous Papers (Topicwise) - Teaching and Research Aptitude Paper-1* Mocktime Publication, NTA NET Previous Papers Topicwise Teaching and Research Aptitude Paper 1 NET JRF Paper 1
