## Test Your Cheb:

**Elementary Numerical Analysis** S. D. Conte, Carl De Boor, 2018-02-27 This book provides a thorough and careful introduction to the theory and practice of scientific computing at an elementary yet rigorous level from theory via examples and algorithms to computer programs The original FORTRAN programs have been rewritten in MATLAB and now appear in a new appendix and online offering a modernized version of this classic reference for basic numerical algorithms

**Hyperbolic Problems: Theory, Numerics, Applications. Volume II** Carlos Parés, Manuel J. Castro, Tomás Morales de Luna, María Luz Muñoz-Ruiz, 2024-06-05 The present volume contains a selection of papers from the XVIII International Conference on Hyperbolic Problems Theory Numerics and Applications HYP2022 which was held on June 20 24 2022 in Málaga Spain The goal of this series of conferences is to bring together scientists with interests in the theoretical applied and computational aspects of hyperbolic partial differential equations systems of hyperbolic conservation laws wave equations etc and of related mathematical models The chapters in this volume correspond to selected contributions related to numerical aspects and applications

**An Introductory Guide to Computational Methods for the Solution of Physics Problems** George Rawitscher, Victor dos Santos Filho, Thiago Carvalho Peixoto, 2018-10-24 This monograph presents fundamental aspects of modern spectral and other computational methods which are not generally taught in traditional courses It emphasizes concepts as errors convergence stability order and efficiency applied to the solution of physical problems The spectral methods consist in expanding the function to be calculated into a set of appropriate basis functions generally orthogonal polynomials and the respective expansion coefficients are obtained via collocation equations The main advantage of these methods is that they simultaneously take into account all available information rather than only the information available at a limited number of mesh points They require more complicated matrix equations than those obtained in finite difference methods However the elegance speed and accuracy of the spectral methods more than compensates for any such drawbacks During the course of the monograph the authors examine the usually rapid convergence of the spectral expansions and the improved accuracy that results when nonequispaced support points are used in contrast to the equispaced points used in finite difference methods In particular they demonstrate the enhanced accuracy obtained in the solution of integral equations The monograph includes an informative introduction to old and new computational methods with numerous practical examples while at the same time pointing out the errors that each of the available algorithms introduces into the specific solution It is a valuable resource for undergraduate students as an introduction to the field and for graduate students wishing to compare the available computational methods In addition the work develops the criteria required for students to select the most suitable method to solve the particular scientific problem that they are confronting

**Data-Driven Modeling & Scientific Computation** J. Nathan Kutz, 2013-08-08 The burgeoning field of data analysis is expanding at an incredible pace due to the proliferation of data collection in almost every area of science The enormous data sets now routinely encountered

in the sciences provide an incentive to develop mathematical techniques and computational algorithms that help synthesize interpret and give meaning to the data in the context of its scientific setting A specific aim of this book is to integrate standard scientific computing methods with data analysis By doing so it brings together in a self consistent fashion the key ideas from statistics time frequency analysis and low dimensional reductions The blend of these ideas provides meaningful insight into the data sets one is faced with in every scientific subject today including those generated from complex dynamical systems This is a particularly exciting field and much of the final part of the book is driven by intuitive examples from it showing how the three areas can be used in combination to give critical insight into the fundamental workings of various problems Data Driven Modeling and Scientific Computation is a survey of practical numerical solution techniques for ordinary and partial differential equations as well as algorithms for data manipulation and analysis Emphasis is on the implementation of numerical schemes to practical problems in the engineering biological and physical sciences An accessible introductory to advanced text this book fully integrates MATLAB and its versatile and high level programming functionality while bringing together computational and data skills for both undergraduate and graduate students in scientific computing
