As a cluster is a group of components, which share common threads, clustered regions is a common structure. In other organizations, in clusters, there are other forms of interacting with other functions, which are the teams that might need to work together. These organizations clusters are based on teams, and therefore, they need to work together, small teams.

The diagram illustrates the evolution of amniotes from a common ancestor. The amniotic egg is shown at the bottom, with the embryo protected by amniotic fluid. Above the egg, the first amniote is depicted with a skull, a notochord, and a neural tube. The diagram then branches into five main groups: 1. **Amniota** (labeled 2), which includes mammals, birds, and reptiles. 2. **Archosauria** (labeled 3), which includes crocodiles, alligators, and birds. 3. **Diapsida** (labeled 4), which includes lizards, snakes, and dinosaurs. 4. **Archosauromorpha** (labeled 5), which includes pterosaurs, dinosaurs, and mammals. 5. **Monotremata** (labeled 6), which includes platypuses and echidnas. The diagram also highlights features of the amniote skull, such as openings in front of the eye and in the jaw, and openings in the side of the skull.

In a cladogram, a node is the intersection of two branches. This node represents the most recent common ancestor shared by the entire tetrapoda clade.

DERIVED CHARACTER

Organisms that benefit a cell

Organisms that branch off after a hash mark share the derived character represented by the hash mark. An embryo protected by amniotic fluid is a derived character shared by all organisms in the amniota clade. Amniotans do not have this derived character.

Which groups of animals belong to the amniota clade? Which belong to the archosauvia clade?
