[Morphology of Crystals](#) Ichiro Sunagawa,1988-02-29 The molecular mechanisms underlying the fact that a crystal can take a variety of external forms is something we have come to understand only in the last few decades This is due to recent developments in theoretical and experimental investigations of crystal growth mechanisms Morphology of Crystals is divided into three separately available volumes Part A contains chapters on roughening transition equilibrium form step pattern theory modern PBC and surface microtopography This part provides essentially theoretical treatments of the problem particularly the solid liquid interface Part B contains chapters on ultra fine particles minerals transition from polyhedral to dendrite theory of dendrite and snow crystals All chapters are written by world leaders in their respective areas and some can be seen as representing the essence of a life s work This is the first English language work which covers all aspects of the morphology of crystals a topic which has attracted top scientific minds for centuries As such it is indispensable for anyone seeking an answer to a question relating to this fascinating problem mineralogists petrologists crystallographers materials scientists workers in solid state physics and chemistry etc In Parts A Fundamentals and B Fine Particles Minerals and Snow equilibrium and kinetic properties of crystals are generally approached from an atomistic point of view In contrast Part C The Geometry of Crystal Growth follows the alternative and complementary geometrical description where bulk phases are considered as continuous media and their interfaces as mathematical surfaces with orientation dependent properties Equations of motion for a crystal surface are expressed in terms of vector and tensor operators working on surface free energy and growth rate both expressed as functions of surface orientation and driving force or affinity for growth This approach emphasizes the interrelation between equilibrium and kinetic behavior Part 1 establishes the theoretical framework

Part 2 gives a construction toolbox for explicit analytic functions An extra chapter is devoted to experimental techniques for measuring such functions a new approach to sphere growth experiments The emphasis throughout is on principles and new concepts Audience Advanced readers familiar with traditional aspects of crystal growth theory Can be used as the basis for an advanced course provided supplementation is provided in the areas of atomistic models of the advancing surface diffusion fields etc Handbook of Crystal Growth D. The Digha Nikaya or the collection of long doctrinal lectures of the Buddha is one of the five Nikayas or collections belonging to the Suttapitaka or the basket of Buddha's discourses which is one of the three major collections of Pali Buddhist texts the other two being Vinayapitaka and Abhidhammapitaka It consists of 34 long suttas of which each individual one treats intensively some particular point or points of the doctrine The Buddha like other Indian teachers of his time taught by conversation He followed the literary habit of his time by embodying his doctrine in set phrases sutras on which he enlarged on different occasions in different ways When the Buddha died these sayings suttas were collected together by his disciples into the great Nikayas of which the present one is the first *Physical Properties of Crystals* J. F. Nye, 1985 First published in 1957 this classic study has been reissued in a paperback version that includes an additional chapter bringing the material up to date The author formulates the physical properties of crystals systematically in tensor notation presenting tensor properties in terms of their common mathematical basis and the thermodynamic relations between them The mathematical groundwork is laid in a discussion of tensors of the first and second ranks Tensors of higher ranks and matrix methods are then introduced as natural developments of the theory A similar pattern is followed in discussing thermodynamic and optical aspects *Рост Кристаллов / Rost Kristallov / Growth of Crystals* A. Chernov, 2012-12-06 Volumes 11 and 12 contain the papers read at the Fourth All Union Conference on Crystal Growth in Tsakhkadzor September 17-22 1972 this volume contains papers on crystal growth from melts from low temperature solutions hydrothermal solutions and hot solutions and also from the gas state including processes involving reactions In addition there are papers on crystal perfection in relation to conditions of formation and the effects of electric and magnetic fields on crystallization These papers reflect researches directed to the development and industrial production of perfect crystals required for advanced techniques in solid state physics and chemistry as well as for other purposes such as novel materials There are many different scientific and technical problems in producing large perfect single crystals and advances in this area made in the USSR and elsewhere are reflected in the papers in both volumes On the one hand any particular defective structure in a crystal originates from some mechanism and growth conditions in particular inclusions are trapped on account of the physicochemical parameters of the melt the surface processes and the stability of the growth front under particular crystallization conditions Further impurity trapping is decisively influenced by the surface kinetics growth front stability composition and structure of the boundary layer any complexes present in the liquid and of course the crys
