The (1+ 1)-nonlinear Universe Of The Parabolic Map

And Combinatorics James D Louck,Myron L Stein,2014-12-30 This monograph develops chaos theory from properties of the graphs inverse to the parabolic map of the interval $0 \leq x \leq 1$ where the height at the midpoint $x = 1/2$ may be viewed as a time like parameter which together with the x coordinate provide the two parameters that uniquely characterize the parabola and which are used throughout the monograph There is only one basic mathematical operation used function composition The functions studied are the n fold composition of the basic parabola with itself However it is the properties of the graph inverse to this n fold composition that are the objects whose properties are developed The reflection symmetry of the basic parabola through the vertical line $x = 1/2$ gives rise to two symmetry classes of inverse graphs the inverse graphs and their conjugates Quite remarkably it turns out that there exists among all the inverse graphs and their conjugates a completely deterministic class of inverse graphs and their conjugates Deterministic in the sense that this class is uniquely determined for all values of the time like parameter and the x coordinate the entire theory of course being highly nonlinear it is polynomial in the time like parameter and in the x coordinate The deterministic property and its implementation are key to the argument that the system is a complex adaptive system in the sense that a few axioms lead to structures of unexpected richness This monograph is about working out the many details that advance the notion that deterministic chaos theory as realized by a complex adaptive system is indeed a new body of mathematics that enriches our understanding of the world around us But

now the imagination is also opened to the possibility that the real universe is a complex adaptive system deceased

Chaos in Chemistry and Biochemistry Richard J. Field, Lszló Győrgyi, 1993 True deterministic chaos is characterized by unpredictable apparently random motion in a dynamical system completely described by a deterministic dynamic law usually

a nonlinear differential equation with no stochastic component The inability to predict future behavior of a chaotic system occurs because trajectories evolving from arbitrarily close initial conditions diverge Chaos is universal as it may arise in any system governed by one of a class of quite common suitable nonlinear dynamic laws This book discusses both the experimental observation and theoretical interpretation of chaos in chemical and biochemical systems Examples are drawn from the Belousov Zhabotinsky reaction surface reactions electrochemical reactions enzyme reactions and periodically perturbed oscillating systems

The Structure of Classical Diffeomorphism Groups Augustin Banyaga, 1997-03-31 The

book introduces and explains most of the main techniques and ideas in the study of the structure of diffeomorphism groups A quite complete proof of Thurston's theorem on the simplicity of some diffeomorphism groups is given The method of the proof is generalized to symplectic and volume preserving diffeomorphisms The Mather Thurston theory relating foliations with diffeomorphism groups is outlined A central role is played by the flux homomorphism Various cohomology classes connected with the flux are defined on the group of diffeomorphisms The main results on the structure of diffeomorphism groups are applied to showing that classical structures are determined by their automorphism groups a contribution to the Erlanger Program of Klein Audience Graduate students and researchers in mathematics and physics
