## **Symbolic Simulation Methods For Industrial Formal Verification:**

*Symbolic Simulation Methods for Industrial Formal Verification* Robert B. Jones, 2012-12-06 Symbolic Simulation Methods for Industrial Formal Verification contains two distinct but related approaches to the verification problem. Both are based on symbolic simulation. The first approach is applied at the gate level and has been successful in verifying sub circuits of industrial microprocessors with tens and even hundreds of thousands of gates. The second approach is applied at a high level of abstraction and is used for high level descriptions of designs. The book contains three main topics: Self consistency, a technique for deriving a formal specification of design behavior from the design itself; The use of the parametric representation to encode predicates as functional vectors for symbolic simulation, an important step in addressing the state explosion problem; Incremental flushing, a method used to verify high level descriptions of out of order execution. Symbolic Simulation Methods for Industrial Formal Verification concludes with work on verification of simplified models of out of order processors.

**Formal Verification** Erik Seligman, Tom Schubert, M. V. Achutha Kiran Kumar, 2015-07-24 Formal Verification: An Essential Toolkit for Modern VLSI Design presents practical approaches for design and validation with hands on advice to help working engineers integrate these techniques into their work. Formal Verification (FV) enables a designer to directly analyze and mathematically explore the quality or other aspects of a Register Transfer Level (RTL) design without using simulations. This can reduce time spent validating designs and more quickly reach a final design for manufacturing. Building on a basic knowledge of SystemVerilog, this book demystifies FV and presents the practical applications that are bringing it into mainstream design and validation processes at Intel and other companies. After reading this book, readers will be prepared to introduce FV in their organization and effectively deploy FV techniques to increase design and validation productivity. Learn formal verification algorithms to gain full coverage without exhaustive simulation. Understand formal verification tools and how they differ from simulation tools. Create instant test benches to gain insight into how models work and find initial bugs. Learn from Intel insiders sharing their hard won knowledge and solutions to complex design problems.

Design and Verification of Microprocessor Systems for High-Assurance Applications David S. Hardin, 2010-03-02 Microprocessors increasingly control and monitor our most critical systems including automobiles, airliners, medical systems, transportation grids and defense systems. The relentless march of semiconductor process technology has given engineers exponentially increasing transistor budgets at constant recurring cost. This has encouraged increased functional integration onto a single die as well as increased architectural sophistication of the functional units themselves. Additionally, design cycle times are decreasing, thus putting increased schedule pressure on engineers. Not surprisingly, this environment has led to a number of uncaught design flaws. Traditional simulation based design verification has not kept up with the scale or pace of modern microprocessor system design. Formal verification methods offer the promise of improved bug finding capability as well as the ability to establish functional correctness of a detailed design relative to a high level specification. However,

widespread use of formal methods has had to await breakthroughs in automated reasoning integration with engineering design languages and processes scalability and usability This book presents several breakthrough design and verification techniques that allow these powerful formal methods to be employed in the real world of high assurance microprocessor system design **Computer Aided Verification** Kousha Etessami,2005-06-24 This book constitutes the refereed proceedings of the 17th International Conference on Computer Aided Verification CAV 2005 held in Edinburgh Scotland UK in July 2005 The 32 revised full papers presented together with 16 tool papers and 3 invited papers as well as a report on a special tools competition were carefully reviewed and selected from 155 submissions The papers cover all current issues in computer aided verification and model checking ranging from foundational and methodological issues to the evaluation of major tools and systems
