## **Syntactic Pattern Recognition:**

**Syntactic Pattern Recognition** Mariusz Flasinski, 2019-03-25 This unique compendium presents the major methods of recognition and learning used in syntactic pattern recognition from the 1960s till 2018. Each method is introduced firstly in a formal way. Then it is explained with the help of examples and its algorithms are described in a pseudocode. The survey of the applications contains more than 1 000 sources published since the 1960s. The open problems in the field, the challenges and the determinants of the future development of syntactic pattern recognition are discussed. This must have volume provides a good read and serves as an excellent source of reference materials for researchers, academics and postgraduate students in the fields of pattern recognition, machine perception, computer vision and artificial intelligence.

**Syntactic Pattern Recognition, Applications** K.S. Fu, 2012-12-06 The many different mathematical techniques used to solve pattern recognition problems may be grouped into two general approaches: the decision theoretic or discriminant approach and the syntactic or structural approach. In the decision theoretic approach a set of characteristic measurements called features are extracted from the patterns. Each pattern is represented by a feature vector and the recognition of each pattern is usually made by partitioning the feature space. Applications of decision theoretic approach include character recognition, medical diagnosis, remote sensing, reliability and socio-economics. A relatively new approach is the syntactic approach. In the syntactic approach each pattern is expressed in terms of a composition of its components. The recognition of a pattern is usually made by analyzing the pattern structure according to a given set of rules. Earlier applications of the syntactic approach include chromosome classification, English character recognition and identification of bubble and spark chamber events. The purpose of this monograph is to provide a summary of the major recent applications of syntactic pattern recognition. After a brief introduction of syntactic pattern recognition in Chapter 1, the nine main chapters (Chapters 2–10) can be divided into three parts. The first three chapters concern with the analysis of waveforms using syntactic methods. Specific application examples include peak detection and interpretation of electrocardiograms and the recognition of speech patterns. The next five chapters deal with the syntactic recognition of two-dimensional pictorial patterns.

**Syntactic and Structural Pattern Recognition** Horst Bunke, Alberto Sanfeliu, 1990 This book is currently the only one on this subject containing both introductory material and advanced recent research results. It presents at one end fundamental concepts and notations developed in syntactic and structural pattern recognition and at the other reports on the current state of the art with respect to both methodology and applications. In particular it includes artificial intelligence related techniques which are likely to become very important in future pattern recognition. The book consists of individual chapters written by different authors. The chapters are grouped into broader subject areas like Syntactic Representation and Parsing, Structural Representation and Matching, Learning etc. Each chapter is a self-contained presentation of one particular

topic In order to keep the original flavor of each contribution no efforts were undertaken to unify the different chapters with respect to notation Naturally the self containedness of the individual chapters results in some redundancy However we believe that this handicap is compensated by the fact that each contribution can be read individually without prior study of the preceding chapters A unification of the spectrum of material covered by the individual chapters is provided by the subject and author index included at the end of the book *Structural, Syntactic, and Statistical Pattern Recognition* Dit-Yan Yeung,2006-08-03 This is the proceedings of the 11th International Workshop on Structural and Syntactic Pattern

Ana Fred, Terry Caelli, Robert P.W. Duin, Aurélio Campilho, Dick de Ridder, 2004-10-29 This volume contains all papers presented at SSPR 2004 and SPR 2004 hosted by the Instituto de Telecomunicações Instituto Superior Técnico Lisbon Portugal August 18-20 2004 This was the fourth time that the two workshops were held back to back The SSPR was the tenth International Workshop on Structural and Syntactic Pattern Recognition and the SPR was the fifth International Workshop on Statistical Techniques in Pattern Recognition These workshops have traditionally been held in conjunction with ICPR International Conference on Pattern Recognition and are the major events for technical committees TC2 and TC1 respectively of the International Association for Pattern Recognition IAPR The workshops were closely coordinated being held in parallel with plenary talks and a common session on hybrid systems This was an attempt to resolve the dilemma of how to deal with the need for narrow focus specialized workshops yet

accommodate the presentation of new theories and techniques that blur the distinction between the statistical and the structural approaches. A total of 219 papers were received from many countries with the submission and reviewing processes being carried out separately for each workshop. A total of 59 papers were accepted for oral presentation and 64 for posters. In addition, four invited speakers presented informative talks and overviews of their research. They were Alberto Sanfeliu from the Technical University of Catalonia, Spain; Marco Gori from the University of Siena, Italy; Nello Cristianini from the University of California, USA; and Erkki Oja from Helsinki University of Technology, Finland, winner of the 2004 Pierre Devijver Award.

### **Advances in Syntactic Pattern Recognition**, 1986

Syntactic and Structural Pattern Recognition Gabriel Ferrate, Theo Pavlidis, Alberto Sanfeliu, Horst Bunke, 2012-02-12. Thirty years ago pattern recognition was dominated by the learning machine concept that one could automate the process of going from the raw data to a classifier. The derivation of numerical features from the input image was not considered an important step. One could present all possible features to a program which in turn could find which ones would be useful for pattern recognition. In spite of significant improvements in statistical inference techniques, progress was slow. It became clear that feature derivation was a very complex process that could not be automated and that features could be symbolic as well as numerical. Furthermore, the spatial relationship amongst features might be important. It appeared that pattern recognition might resemble language analysis since features could play the role of symbols strung together to form a word. This led to the genesis of syntactic pattern recognition, pioneered in the middle and late 1960s by Russel Kirsch, Robert Ledley, and Nararimhan.

and Allan Shaw However the thorough investigation of the area was left to King Sun Fu and his students who until his untimely death produced most of the significant papers in this area One of these papers syntactic recognition of fingerprints received the distinction of being selected as the best paper published that year in the IEEE Transaction on Computers Therefore syntactic pattern recognition has a long history of active research and has been used in industrial applications
