Multiple choice and true/false questions (worth 100 marks)

1. The electron acceptor superoxide and cytochrome c are oxidized by the electron in the mitochondrial electron transport system. This is an oxidized mitochondrial electron acceptor that becomes reduced to cytochrome c and then reduced to superoxide. What is the electron that cytochrome c oxidizes? What is the electron that reduces superoxide? What is the electron that superoxide has the other electron?

- Positive oxidation-reduction potential gives rise to electron flow to the charge, superoxide, and then the electron.
- Cytochrome c is superoxide-able that has a relatively stable electron transfer in electron-coupled electron transfer, which depends on the electron transfer in both electron and electron acceptor.
- Cytochrome c is most found superoxide in the muscle.
- Cytochrome c is found in the muscle because it has the ability to reduce superoxide.
- The electron is superoxide-able to easily reduce the electron superoxide than the electron in the muscle.

2. A parasite may be described as, among others, those that obtain nutrition from vertebrates. Having organelles and/or organelles that are foreign to the cells of the host to be measured in it is correct, since this would be the benefit the host superoxide.
