10.25 hours were spent above the surface and 10.25 hours of darkness. Individual differences in weather were largest, migration and low temperatures could predict the group's altitude migration. However, region of the group predicted the movement of the birds.

In addition to predicted weather, there would likely be other, unmeasured variables that govern migration. For the most part, these variables are cluster specific.

Individual variation in migration is also likely to be a function of the weather. Temperature, humidity, and altitude have a significant impact.

Altitude gains (losses) in 2000 degrees were recorded. 20 degrees are considered a normal variation with 1000. Above 20 degrees are considered to be extreme.
