System Identification Karel J. Keesman, 2011-05-16 System Identification shows the student reader how to approach the system identification problem in a systematic fashion The process is divided into three basic steps experimental design and data collection model structure selection and parameter estimation and model validation each of which is the subject of one or more parts of the text Following an introduction on system theory particularly in relation to model representation and model properties the book contains four parts covering data based identification non parametric methods for use when prior system knowledge is very limited time invariant identification for systems with constant parameters time varying systems identification primarily with recursive estimation techniques and model validation methods A fifth part composed of appendices covers the various aspects of the underlying mathematics needed to begin using the text The book uses essentially semi physical or gray box modeling methods although data based transfer function system descriptions are also introduced The approach is problem based rather than rigorously mathematical The use of finite input output data is demonstrated for frequency and time domain identification in static dynamic linear nonlinear time invariant and time varying systems Simple examples are used to show readers how to perform and emulate the identification steps involved in various

control design methods with more complex illustrations derived from real physical chemical and biological applications being used to demonstrate the practical applicability of the methods described End of chapter exercises for which a downloadable instructors Solutions Manual is available from fill in URL here will both help students to assimilate what they have learned and make the book suitable for self tuition by practitioners looking to brush up on modern techniques Graduate and final year undergraduate students will find this text to be a practical and realistic course in system identification that can be used for assessing the processes of a variety of engineering disciplines System Identification will help academic instructors teaching control related to give their students a good understanding of identification methods that can be used in the real world without the encumbrance of undue mathematical detail *Identification of Dynamic Systems* Rolf Isermann,Marco Münchhof,2014-11-23 Precise dynamic models of processes are required for many applications ranging from control engineering to the natural sciences and economics Frequently such precise models cannot be derived using theoretical considerations alone Therefore they must be determined experimentally This book treats the determination of dynamic models based on measurements taken at the process which is known as system identification or process identification Both offline and online methods are presented i e methods that post process the measured data as well as methods that provide models during the measurement The book is theory oriented and application oriented and most methods covered have been used successfully in practical applications for many different processes Illustrative examples in this book with real measured data range from hydraulic and electric actuators up to combustion engines Real experimental data is also provided on the Springer webpage allowing readers to gather their first experience with the methods presented in this book Among others the book covers the following subjects determination of the non parametric frequency response fast Fourier transform correlation analysis parameter estimation with a focus on the method of Least Squares and modifications identification of time variant processes identification in closed loop identification of continuous time processes and subspace methods Some methods for nonlinear system identification are also considered such as the Extended Kalman filter and neural networks The different methods are compared by using a real three mass oscillator process a model of a drive train For many identification methods hints for the practical implementation and application are provided The book is intended to meet the needs of students and practicing engineers working in research and development design and manufacturing

Errors-in-Variables Methods in System Identification Torsten Söderström,2018-04-07 This book presents an overview of the different errors in variables EIV methods that can be used for system identification Readers will explore the properties of an EIV problem Such problems play an important role when the purpose is the determination of the physical laws that describe the process rather than the prediction or control of its future behaviour EIV problems typically occur when the purpose of the modelling is to get physical insight into a process Identifiability of the model parameters for EIV problems is a non trivial issue and sufficient conditions for identifiability are given The author covers various modelling aspects which taken together can find a solution

including the characterization of noise properties extension to multivariable systems and continuous time models The book finds solutions that are constituted of methods that are compatible with a set of noisy data which traditional approaches to solutions such as total least squares do not find A number of identification methods for the EIV problem are presented Each method is accompanied with a detailed analysis based on statistical theory and the relationship between the different methods is explained A multitude of methods are covered including instrumental variables methods methods based on bias compensation covariance matching methods and prediction error and maximum likelihood methods The book shows how many of the methods can be applied in either the time or the frequency domain and provides special methods adapted to the case of periodic excitation It concludes with a chapter specifically devoted to practical aspects and user perspectives that will facilitate the transfer of the theoretical material to application in real systems Errors in Variables Methods in System Identification gives readers the possibility of recovering true system dynamics from noisy measurements while solving over determined systems of equations making it suitable for statisticians and mathematicians alike The book also acts as a reference for researchers and computer engineers because of its detailed exploration of EIV problems
