Neurobiology of Aging J. Ord,2013-06-29 Aging is one of the most universal and inevitable social and scientific challenges confronting man The lives of all multicellular organisms begin with conception extend through phases of development maturity senescence and finally end in death Man is no exception but has the unique feature of a complex brain It plays an integrative role in adaptation to the physical and social environments through reflexes conditioning and more complex forms of learning The brain is a repository for both inherited and acquired information With the development of speech and the formation of symbolic language the human brain has made it possible to transmit information culturally horizontal to other members of society in addition to genetic vertical transmission to progeny This horizontal transmission which has reached its highest form in man is a powerful extension of genetic transmission The brain may provide man all that

is of importance in life. It has played a key role in the evolution of life by maintaining and extending the life span. Many mental or intellectual capacities of man reach a peak in early adulthood, remain relatively constant throughout maturity and then appear to decline during senescence. Behaviorally, there appears to be a decrease in sensory learning and motor functions with aging in all mammalian species. As integrated adaptive control systems, the brain and neuroendocrines have been closely associated with the homeostatic adaptation to environmental challenges throughout the life span. This is then followed by a chapter outline for quick access to material and chapter objectives to focus the student on the most important material in that chapter.

As the Handbook of Behavioral Neurobiology moves into a second volume, it is appropriate to take into general account the scope and content of this series. In its broadest sense, behavioral neurobiology is the study of the behaviors of animal organisms with reference to their neurological bases. The overall objective of this handbook series is to assemble in ten volumes a comprehensive and up to date treatment of the major areas that comprise behavioral neurobiology. Within such a framework, it is possible to provide the fundamental concepts, methods and substantive advancements in these fields in a manner that will be useful to and that will also serve as a reference source for researchers, educational programs who desire a well balanced overview of the component areas of neurobiology. The intent in each volume has been to bring together a spectrum of approaches and disciplines that focuses upon the topic at hand. The first volume presented and discussed the problems of sensory integration; the present work is concerned with the neurobiology of cognitive processes and forthcoming volumes will include the topics of motor coordination, learning and memory, biological rhythms, motivation, sexual behavior, social behavior and communication and the evolution of nervous systems and behavior. Thus the purpose of the editors in planning this series has been to offer a distinct handbook employing the many varied and prevailing avenues of attack upon current problems in behavior and neurological processes that should prove of unique value and usefulness to professionals and students alike.
