**Electrical Properties of Tissues** Rosalind Sadleir, Atul Singh Minhas, 2022-10-28 This book covers the latest developments in tissue electrical conductivity and current density imaging increasingly popular as well as challenging applications of MRI. These applications are enabled by the acquisition of high quality MR phase images. This book provides a practical description of the MRI physics needed to understand and acquire phase images in MRI and the key details required to reconstruct them into conductivity current density or electric field distributions. Comprehensive details are provided about the electrical properties of biological tissues computational modeling considerations experimental methods construction of non biological and biological phantoms and MRI pulse sequences. An inclusive review of image reconstruction algorithms and their potential applications is provided for applications directed at determining current density or electric fields such as in transcranial DC or AC stimulation techniques as well as electrical conductivity reconstructions that may be of use in quantitative MRI applications used to detect cancer or other pathologies. This is an excellent book for undergraduate and graduate students beginning to explore phase current density and conductivity imaging in MRI and will also be of great use to researchers interested in the area of MR based electrical property imaging. *MRI of Short- and Ultrashort-T2 Tissues* Jiang Du, Graeme M. Bydder, 2024-02-21 This book comprehensively covers ultrashort echo time UTE zero echo time ZTE and other magnetic resonance imaging MRI acquisition techniques for imaging of short and ultrashort T2 tissues. MRI uses a large magnet and radio waves to generate images of tissues in the body. The MRI signal is characterized by two time constants spin lattice relaxation time T1 which describes how fast the longitudinal magnetization recovers to its initial value after tipping to the transverse plane and spin spin relaxation time T2 which describes how fast the transverse magnetization decays. Conventional MRI techniques have been developed to image and quantify tissues with relatively long T2s. However the body also contains many tissues and tissue components such as cortical bone menisci ligaments tendons the osteochondral junction calcified tissues lung parenchyma iron containing tissues and myelin which have short or ultrashort T2s. These tissues are invisible with conventional MRI and their MR and tissue properties are not measurable. UTE and ZTE type sequences resolve these challenges and make these tissues visible and quantifiable. This book first introduces the basic physics of conventional MRI as well as UTE and ZTE type MRI including radiofrequency excitation data acquisition and image reconstruction. A series of contrast mechanisms are then introduced and these provide high resolution high contrast imaging of short and ultrashort T2 tissues. A series of quantitative UTE imaging techniques are described for measurement of MR tissue properties proton density T1 T2 T2 T1p magnetization transfer susceptibility perfusion and diffusion. Finally clinical applications in the musculoskeletal neurological pulmonary and cardiovascular systems are described. This is an ideal guide for physicists and radiologists interested in learning more about the use of UTE and ZTE type techniques for MRI of short and ultrashort T2 tissues.
