The Disposition Of Stones:

Hearings on H.R. 15081 to Authorize the Disposal of Various Materials from the National Stockpile and the Supplemental Stockpile, and for Other Purposes, Before the Subcommittee on Seapower and Strategic and Critical Materials of the Committee on Armed Services, House of Representatives, Ninety-fourth Congress, Second Session, August 26, September 1, 1976 United States. Causation, Explanation, and the Metaphysics of Aspect Bradford Skow, 2018-12-06 When you light a match it is the striking of it which causes the lighting the presence of oxygen in the room is a background condition to the lighting But in virtue of what is the striking a cause while the presence of oxygen is a background condition When a fragile glass breaks it manifests a disposition to break when struck however not everything that breaks manifests this disposition So under what conditions does something in breaking manifest fragility After some therapy a man might stop being irascible and he might lose the disposition to become angry at the slightest provocation If he does then he will have lost the disposition after an internal change Can someone lose or gain a disposition merely as a result of a change in its external circumstances Facts about the structure of society can it seems explain other facts But how do they do it Are there different kinds of structural explanations Many things are said to be causes a rock when we say that the rock caused the window to break and an event when we say that the striking of the window caused its breakage Which kind of causation causation by events or causation by things is more basic In Causation Explanation and the Metaphysics of Aspect Bradford Skow defends answers to these questions His answers rely on a pair of connected distinctions first is the distinction between acting or doing something and not acting second is the distinction between situations in which an event happens and situations in which instead something is in some state The first distinction is used to draw the second an event happens if and only if something does something

Selection and Investigation of Sites for the Disposal of Radioactive Wastes in Hydraulically Induced Subsurface Fractures Ren Jen Sun, Geological Survey (U.S.), 1982 Injection of intermediate level radioactive wastes specific activity of less than 6×10^3 Ci/mL consisting mainly of radionuclides such as strontium and cesium having half lives of less than 50 years mixed with cement into a thick shale formation is a promising and feasible disposal method Hydraulic fracturing provides openings in the shale to accommodate the wastes Ion exchange and radionuclide adsorption materials can be added to the grout during mixing to further increase the radionuclide retaining capacity of the grout After solidification of the grout the injected wastes become an integral part of the shale formation and therefore the wastes will remain at depth and in place as long as the injection zone is not subjected to erosion or dissolution Problems concerning safety of the disposal method are 1 the potential for inducing vertical fractures 2 phase separation during and after the injections 3 the reliability of methods for determining the orientation of induced fractures 4 the possibility of triggering earthquakes and 5 radionuclides being leached and

transported by ground water In bedded shale a difference between tensile strength normal to and that parallel to bedding planes favors the formation of fractures along bedding planes that are nearly horizontal Even in areas where vertical stress is slightly greater than the horizontal stresses nearly horizontal bedding plane fractures can be hydraulically induced in shale at depths less than 1 000 meters Test injections should be made during site evaluation to determine if horizontal bedding plane fractures can be induced The orientation of induced fractures can be indirectly monitored by recording injection pressures during injection time and by measuring the decay of water injections and the uplift of ground surface after the injections however it can be directly determined by gamma ray logs made in observation wells before and after each injection if the injected fluid or wastes contain enough gamma ray emitting radionuclides If waste grout is properly mixed phase separation should be less than one percent of the total amount injected The mobility of waste in the separated liquid is further decreased by the low permeability less than 10⁻⁶ darcy and the large ion exchange and adsorption capacity of shale which thus reduce the potential for contamination Grout injections do not cause extensive increases in pore pressure within shale and a disposal site should be located in a geologically stable and tectonically relaxed area that is an area lacking local active faults Thus a disposal in shale in such areas can avoid the two necessary and essential conditions for triggering earthquakes by fluid injections an increase in pore pressure and rock already stressed near its breaking strength Waste injections are made in several stages at different levels through an injection well After the first series of injections at the greatest depth the well is plugged by cement at that depth The second series of injections are made a suitable distance above the first The repeated use of the injection well distributes the cost of constructing injection and monitoring wells over many injections thereby making hydraulic fracturing and grout injection economically attractive as a method for the disposal of radioactive wastes Theoretical considerations about inducing nearly horizontal beddingplane fractures in shale are discussed as are field procedures for site selection safety and the monitoring and operation of radioactive waste disposal Case histories are used as examples to demonstrate the application of the theory and techniques of field operations *Crown Jewel Mine Project, Okanogan County D(2v), Dsum, F(4v), Fsum; Record of Decision* ,1997
