## **Land Use Nature Conservation And The Stability Of Rainforest Margins In Southeast Asia:**

### **Land Use, Nature Conservation and the Stability of Rainforest Margins in Southeast Asia** Gerhard

Gerold, Michael Fremerey, Edi Guhardja, 2013-06-29 Southeast Asia constitutes one of the world's most extended rainforest regions. It is characterized by a high degree of biodiversity and contains a large variety of endemic species. Moreover, these forests provide a number of important and singular ecosystem services like erosion protection and provision of high quality water which cannot be replaced by alternative ecosystems. However, various forms of encroachment, mostly those made by human interventions, seriously threaten the continuance of rainforests in this area. There is ample evidence that the rainforest resources, apart from large-scale commercial logging, are exposed to danger, particularly from its margin areas. These areas, which are characterized by intensive man-nature interaction, have been identified as extremely fragile systems. The dynamic equilibrium that balances human needs and interventions on the one hand and natural regeneration capacity on the other is at stake. The decrease of rainforest resources is to a substantial degree connected with the destabilization of these systems. Accordingly, the search for measures and processes which prevent destabilization and promote stability is regarded as imperative. This refers to both the human and the natural part of the forest margin ecosystem. Tropical Rainforests and Agroforests under Global Change Teja Tscharntke, Christoph Leuschner, Edzo Veldkamp, Heiko Faust, Edi Guhardja, Arifuddin Bidin, 2010-02-04 not only for land use systems that depend on the regular supply of rain or irrigation water but also for the future development of natural rainforests as drought stress has been shown to affect tree growth and species composition in old-growth forests. Wright 1991, Walsh and Newbery 1999, Engelbrecht et al 2007. A drought experiment conducted in a cacao agroforestry plantation showed that this plantation was surprisingly resilient to an induced drought of more than a year. Schwendenmann et al 2009. However, droughts can have a strong impact on household incomes from agriculture; they strongly affect the vulnerability to poverty and thus have to be analyzed as important exogenous shocks to households forcing them to adjust their behaviour and develop strategies to cope with these problems. The stability of rainforest margins is a critical factor in the protection of tropical rainforests. Tscharntke et al 2007. At present, however, rainforest margins in many parts of the tropics are far from stable, both in socio-economic and in ecological terms. For example, protected areas may attract rather than repel human settlement, which may be due to international donor investment in national conservation programs. Wittemeyer et al 2008. An alternative hypothesis is that protected areas might be compromised if leakage takes place, that is, if impacts that would take place inside the restricted area are displaced to a nearby undisturbed area. Ewers and Rodrigues 2008.

Burkard, Michael Fremerey, 2008 This volume contains a collection of articles based on empirical social science research in forest margin communities around the Lore Lindu National Park in Central Sulawesi Indonesia It refers to a worldwide and particularly topical issue i e the declining forest resources and man s role in the observed processes of nature degradation However it refrains from rather simplistic protectionist approaches which boil down to a separation between man and nature in order to avoid the depletion of natural resources Instead the approach adopted regards the existence or development of co evolutionary potentials both in nature and human society as a precondition for the establishment of a sustainable equilibrium in the interaction between man and nature **Participatory Approaches for Sustainable Land Use in Southeast Asia**
