## **Tectonic Settings On Regional Metamorphism:**

**Tectonic Settings of Regional Metamorphism** Royal Society (Great Britain). Discussion Meeting, 1987      *Tectonic Settings of Regional Metamorphism* E. R. Oxburgh, B. W. D. Yardley, P. C. England, 1987      **Tectonic Settings of Regional Metamorphism** E. R. Oxburgh, B. W. D. Yardley, P. C. England, 1987      **Tectonic Setting and Gondwana Basin Architecture in the Indian Shield** Subhrangsu Acharyya, 2018-12-04 Tectonic Setting and Gondwana Basin Architecture in the Indian Shield Volume Four is the newest book in the Problems and Solutions in Structural Geology and Tectonics series from Elsevier and is a synthesized monograph on the tectonic settings of Gondwana basins of India It is a unique book on a topic of national and international interest especially given the economic importance of the region coal reserves The book is authored and edited by very experienced theoretical experts and explores and reconstructs unified stratigraphic research of the region including the relative role of tension and lateral movement in basin formation Basin formation is the driving force behind formation and break up of supercontinents and the time frame of supercontinent cycles Provides the latest data on the tectonic settings of Gondwana basins of India Explores the unified stratigraphic research of the region Authored and edited by experienced theoretical experts      *The Tectonic Setting and Origin of Cretaceous Batholiths within the North American Cordillera* Robert S. Hildebrand, Joseph B. Whalen, 2017-10-03 In this Special Paper Hildebrand and Whalen present a big picture paradigm busting synthesis that examines the tectonic setting temporal relations and geochemistry of many plutons within Cretaceous batholithic terranes of the North American Cordillera In addition to their compelling tectonic synthesis they argue that most of the batholiths are not products of arc magmatism as commonly believed but instead were formed by slab failure during and after collision They show that slab window and Precambrian TTG suites share many geochemical similarities with Cretaceous slab failure rocks Geochemical and isotopic data indicate that the slab failure magmas were derived dominantly from the mantle and thus have been one of the largest contributors to growth of continental crust The authors also note that slab failure plutons emplaced into the epizone are commonly associated with Cu Au porphyries as well as Li Cs Ta pegmatites      **Tectonic Setting and Lithology of the Winterhaven Formation** Gordon Haxel, Richard M. Tosdal, John T. Dillon, 1985 Analyzes the lithology of a sequence of supercrustal rocks in southeasternmost California and southwesternmost Arizona known as the Winterhaven Formation presenting data on its geologic setting stratigraphy metamorphism and deformation basal contact and age and providing conclusions concerning its tectonic significance      **Tectonic Settings of Regional Metamorphism** ,      Tectonic Setting of Faulted Tertiary Strata Associated with the Catalina Core Complex in Southern Arizona William R. Dickinson, 1991 Mid Tertiary strata exposed as tilted homoclines along the flanks of the San Pedro trough and across broad uplands north of the Catalina core complex are assigned to the following formations each of which includes informal local members and facies a Mineta Formation mid Oligocene redbeds including both conglomeratic fluvial and finer grained lacustrine deposits b Galiuro Volcanics including

lavas and domes air fall and ash flow tuffs and intercalated volcanoclastic strata of late Oligocene to earliest Miocene age c Cloudburst Formation also of late Oligocene and earliest Miocene age but including a sedimentary upper member of conglomeratic strata as well as a volcanic lower member correlative with part of the Galiuro Volcanics and d San Manuel Formation composed of lower Miocene alluvial fan and braidplain deposits that display contrasting clast assemblages in different areas of exposure Generally correlative Oligocene Miocene strata exposed south of the Catalina core complex are assigned to the Pantano Formation which contains similar lithologic components Less deformed Neogene strata of post mid Miocene basin fill are assigned to the Quiburis Formation along the San Pedro trough but stratigraphic equivalents elsewhere lack adequate nomenclature High benchlands mantled by paleosols mark the highest levels of Neogene aggradation Successive stages of subsequent erosional dissection are recorded by multiple terrace levels incised into basin fill Key exposures of syntectonic mid Tertiary sedimentary sequences in several local subareas reveal typical structural and stratigraphic relationships Multiple fault blocks expose pre Tertiary bedrock overlain by tilted mid Tertiary strata confined to intervening half grabens Bounding syndepositional faults dip southwest and associated homoclines dip northeast Fanning dips and buttress unconformities reflect progressive tilt and burial of eroding fault blocks Dips of block bounding faults are inversely proportional to the ages of the faults Steeper dips for younger faults suggest either progressive erosion of successive listric faults or progressive rotation of successive planar faults Uniformly moderate to steep dihedral angles between fault surfaces and offset homoclinal bedding imply that the faults dipped more steeply near the surface when syntectonic mid Tertiary strata were subhorizontal Although the inference of listric faulting best links apparent strands of the Catalina detachment system the alternate interpretation of rotational normal faulting is compatible with local structural relationships including tilt of porphyry copper orebodies Within the San Pedro trough multiple homoclines of mid Tertiary strata are exposed locally in tilt blocks exhumed by Neogene erosion from beneath nearly flat lying basin fill of the Quiburis Formation Faults bounding the mid Tertiary exposures include backtilted strands of the Catalina detachment system somewhat younger listric or rotational normal faults and steeper basin range normal faults that display offsets both synthetic and antithetic to the flanks of the San Pedro trough In Cienega Gap flanking the Tucson Basin multiple tilt blocks of the Pantano Formation form part of the upper plate of the Catalina detachment system Initial construction of alluvial fans by generally westward paleoflow was followed by ponding of lacustrine environments along the foot of secondary breakaway scarps that also generated massive megabreccia deposits In summary syntectonic Oligocene to Miocene sedimentation succeeded a prominent pulse of polymodal mid Tertiary volcanism and was coeval with mylonitic deformation and detachment faulting along the flank of the Catalina core complex The headwall rupture for the detachment system migrated westward from an initial position along the range front of the Galiuro Mountains After mid Miocene time accumulation and subsequent dissection of essentially undeformed basin fill was accompanied by basin range block faulting The most

challenging structural issue is whether fault strands of the Catalina detachment system are interconnected or are disconnected rotational segments

Geological History of Britain and Ireland Nigel H. Woodcock, R. A. Strachan, 2012-04-12

Britain and Ireland have a remarkably varied geology for so small a fragment of continental crust with a fine rock record back through three billion years of geological time This history would have been interesting enough if it had been played out on relatively stable continental crust However Britain and Ireland have developed at a tectonic crossroads on crust once traversed by subduction zones and volcanic arcs continental rifts and mountain belts The resulting complexity is instructive fascinating and perplexing Geological History of Britain and Ireland tells the region's story at a level accessible to undergraduate geologists as well as to postgraduates professionals or informed amateurs This second edition is fully revised and updated reflecting our continually developing knowledge of the region's geology Full coverage is again given to the rich Precambrian and Early Palaeozoic history as well as to later events more relevant to hydrocarbon exploration The book is an essential starting point for more detailed studies of the regional geology Additional resources for this book can be found at <http://www.wiley.com/go/woodcock/geologicalhistory>

Tectonic Settings of Regional Metamorphism, 1987

Regional Metamorphism of Ore Deposits and Genetic Implications Paul G. Spry, Lubonir Taras Bryndzia, 1990-12

The unifying theme to the papers in this volume is that they deal with economic accumulations of sulfide minerals which together with their host rocks have been affected to varying degrees by regional metamorphism The principle sulfide deposit types discussed are stratabound ZnCuPbAgBa deposits in regionally metamorphosed terranes which occur in a diverse variety of host lithologies In addition other interesting deposit types are discussed and examples are presented from various parts of the world The topics treated in this volume are the interaction of sulfide minerals with their host rocks during regional metamorphism the quantitative interpretation of P-T-time histories of regional metamorphism in which both sulfide and silicate phase relations must be considered together in order to meaningfully interpret the metamorphic history the question of how to identify progenitors of rocks modified by tectonic and metamorphic processes and the implications of these studies developing future exploration strategies for massive sulfide deposits in metamorphic terranes
