Communication Networks Cheng-Shang Chang, 2000 Providing performance guarantees is one of the most important issues for future telecommunication networks This book describes theoretical developments in performance guarantees for telecommunication networks from the last decade Written for the benefit of graduate students and scientists interested in telecommunications network performance this book consists of two parts The first introduces the recently developed filtering theory for providing deterministic hard guarantees such as bounded delay and queue length The filtering theory is developed under the min plus algebra where one replaces the usual addition with the min operator and the usual multiplication with the addition operator As in the classical linear system theory the filtering theory treats an arrival process or a departure process as a signal and a network element as a system Network elements including traffic regulators and servers can be modelled as linear filters under the min plus algebra and they can be joined by concatenation filter bank summation and feedback to form a composite network element The problem of providing deterministic guarantees is equivalent to finding the impulse response of composite network elements This section contains material on s r calculus Filtering theory for deterministic traffic regulation service guarantees and networks with variable length packets Traffic specification Networks with multiple inputs and outputs Constrained traffic regulation The second part of the book addresses stochastic soft guarantees focusing mainly on tail distributions of queue lengths and packet loss probabilities and contains material on s q r q calculus and q envelope rates The large deviation principle The theory of effective bandwidth The mathematical theory for stochastic guarantees is the theory of effective bandwidth Based on the large deviation principle the theory of effective bandwidth provides approximations for the bandwidths required to meet stochastic guarantees for both short range dependent inputs and long range dependent inputs Telecommunications Network Planning Brunilde Sansò, Patrick Soriano, 2012-12-06

Telecommunications central to our daily lives continues to change dramatically These changes are the result of technological advances deregulation the proliferation of broadband service offers and the spectacular popularity of the Internet and wireless services In such adynamic technological and economic environment competition is increasing among service providers and among equipment manufacturers Consequently optimization of the planning process is becoming essential Although telecommunications network planning has been tackled by the Operations Research community for some time many fundamental problems remain challenging Through its fourteen chapters this book covers some new and some still challenging older problems which arise in the planning of telecommunication networks Telecommunications Network

Planning will benefit both telecommunications practitioners looking for efficient methods to solve their problems and operations researchers interested in telecommunications. The book examines network design and dimensioning problems it explores Operation Research issues related to a new standard Asynchronous Transfer Mode ATM it overviews problems that arise when designing survivable SDH SONET Networks it considers some broadband network problems and it concludes with three chapters on wireless and mobile networks. Leading area researchers have contributed their recent research on the telecommunications and network topics treated in the volume.
