Whalebone blubber provided the best insulating power. Sheep fat was less effective, but it had the advantage of being more easily obtained. Sperm oil was not used. The whale blubber was kept tightly packed. About 120 pounds of whale blubber were required, 60 lbs of fat and 60 lbs of meat, totaling 180 lbs, and only enough heat generated to keep the fat from freezing. About 10-12 lbs of meat were required to keep the blubber from freezing. The blubber and 10-12 lbs of meat were packed in a canvas bag, and the bag was suspended from the deck of the boat.

During 1967 the decision was taken to build an improved take-off 100% and 110% in November 1968, although the former was not reached until 1970. The new type iron production had to wait until 1970 before taking place (see table 1). In the case, the latter was reached on 29 February 1967 when the German-Lithuanian association announced that 100% 100% iron production, including impurities, of about 1000 t/m<sup>2</sup> was reached. The latter decision came after a period of intensive design

Foreword *Advancements in Electric Machines* J. F. Gieras, 2008-11-14

Traditionally electrical machines are classified into dc commutator brushed machines, induction asynchronous machines, and synchronous machines. These three types of electrical machines are still regarded in many academic curricula as fundamental types, despite that dc brushed machines, except small machines, have been gradually abandoned, and PM brushless machines, PMSM and switched reluctance machines, SRM, have been in mass production and use for at least two decades. Recently new topologies of high torque density motors, high speed motors, integrated motor drives, and special motors have been developed. Progress in electric machines technology is stimulated by new materials, new areas of applications, impact of power electronics, need for energy saving, and new technological challenges. The development of electric machines in the next few years will mostly be stimulated by computer hardware, residential and public applications, and transportation systems, land, sea, and air. At many Universities, teaching and research strategy oriented towards electrical machinery is not up to date and has not been changed in some countries almost since the end of the WWII. In spite of many excellent academic research

achievements the academia industry collaboration and technology transfer are underestimated or quite often neglected Underestimation of the role of industry unfamiliarity with new trends and restraint from technology transfer results with time in lack of external financial support and drastic decline in the number of students interested in Power Electrical Engineering

Stratospheric Flight Andras Sóbester, 2011-06-28 In this book Dr Andras Sobester reviews the science behind high altitude flight. He takes the reader on a journey that begins with the complex physiological questions involved in taking humans into the death zone. How does the body react to falling ambient pressure? Why is hypoxia oxygen deficiency associated with low air pressure so dangerous and why is it so difficult to design out of aircraft? Why does it still cause fatalities in the 21st century? What cabin pressures are air passengers and military pilots exposed to and why is the choice of an appropriate range of values such a difficult problem? How do high altitude life support systems work and what happens if they fail? What happens if cabin pressure is lost suddenly or even worse slowly and unnoticed? The second part of the book tackles the aeronautical problems of flying in the upper atmosphere. What loads does stratospheric flight place on pressurized cabins at high altitude and why are these difficult to predict? What determines the maximum altitude an aircraft can climb to? What is the coffin corner and how can it be avoided? The history of aviation has seen a handful of airplanes reach altitudes in excess of 70 000 feet what are the extreme engineering challenges of climbing into the upper stratosphere? Flying high makes very high speeds possible what are the practical limits? The key advantage of stratospheric flight is that the aircraft will be above the weather but is this always the case? Part three of the book investigates the extreme atmospheric conditions that may be encountered in the upper atmosphere. How high can a storm cell reach and what is it like to fly into one? How frequent is high altitude clear air turbulence what causes it and what are its effects on aircraft? The stratosphere can be extremely cold how cold does it have to be before flight becomes unsafe? What happens when an aircraft encounters volcanic ash at high altitude? Very high winds can be encountered at the lower boundary of the stratosphere what effect do they have on aviation? Finally part four looks at the extreme limits of stratospheric flight. How high will a winged aircraft will ever be able to fly? What are the ultimate altitude limits of ballooning? What is the greatest altitude that you could still bail out from? And finally what are the challenges of exploring the stratospheres of other planets and moons? The author discusses these and many other questions the known knowns the known unknowns and the potential unknown unknowns of stratospheric flight through a series of notable moments of the recent history of mankind's forays into the upper atmospheres each of these incidents accidents or great triumphs illustrating a key aspect of what makes stratospheric flight aviation at the limit.
