Model Checking Software María del Mar Gallardo, Pedro Merino, 2018-06-15 This book constitutes the refereed proceedings of the 25th International Symposium on Model Checking Software SPIN 2018 held in Malaga Spain in June 2018. The 14 papers presented (1 short paper and 1 demo tool paper) were carefully reviewed and selected from 28 submissions. Topics covered include formal verification techniques for automated analysis of software formal analysis for modeling languages such as UML state charts formal specification languages temporal logic design by contract model checking automated theorem proving including SAT and SMT verifying compilers abstraction and symbolic execution techniques and much more.

Generalized Differential and Integral Quadrature Francesco Tornabene, 2023-10-17 The main aim of this book is to analyze the mathematical fundamentals and the main features of the Generalized Differential Quadrature GDQ and Generalized Integral Quadrature GIQ techniques. Furthermore, another interesting aim of the present book is to show that from the two numerical techniques mentioned above it is possible to derive two different approaches such as the Strong and Weak Finite Element Methods SFEM and WFEM that will be used to solve various structural problems and arbitrarily shaped structures. A general approach to the Differential Quadrature is proposed. The weighting coefficients for different basis functions and grid distributions are determined. Furthermore, the expressions of the principal approximating polynomials and grid distributions available in the literature are shown. Besides the classic orthogonal polynomials, a new class of basis functions which depend on the radial distance between the discretization points is presented. They are known as Radial Basis Functions or RBFs. The general expressions for the derivative evaluation can be utilized in the local form to reduce the computational cost. From this concept, the Local Generalized Differential Quadrature LGDQ method is derived. The Generalized Integral Quadrature GIQ technique can be used employing several basis functions without any restriction on the point distributions for the given definition domain. To better underline these concepts, some classical numerical integration schemes are reported such as the trapezoidal rule or the Simpson method. An alternative approach based on Taylor series is also illustrated to approximate integrals. This technique is named as Generalized Taylor based Integral Quadrature GTIQ method. The major structural theories for the analysis of the mechanical behavior of various structures are presented in depth in the book. In particular, the strong and weak formulations of the corresponding governing equations are discussed and illustrated. Generally speaking, two formulations of the same system of governing equations can be developed which are respectively the strong and weak or variational formulations. Once the governing equations that rule a generic structural problem are obtained together with the corresponding boundary conditions, a differential system is written. In particular, the Strong Formulation SF of the governing equations is obtained. The differentiability requirement is instead reduced through a weighted integral statement if the corresponding Weak Formulation WF of the governing equations is developed. Thus, an equivalent integral formulation is derived starting directly from the previous one. In particular, the formulation in hand is

obtained by introducing a Lagrangian approximation of the degrees of freedom of the problem The need of studying arbitrarily shaped domains or characterized by mechanical and geometrical discontinuities leads to the development of new numerical approaches that divide the structure in finite elements Then the strong form or the weak form of the fundamental equations are solved inside each element The fundamental aspects of this technique which the author defined respectively Strong Formulation Finite Element Method SFEM and Weak Formulation Finite Element Method WFEM are presented in the book

Model Checking Software Dragan Bosnacki, Stefan Edelkamp, 2007-08-30 This book presents the proceedings of the 14th International SPIN workshop on Model Checking Software held in Berlin Germany Fourteen full papers are presented together with four tool presentation papers and the abstracts of two invited talks The papers are organized into topical sections covering directed model checking partial order reduction program analysis exploration advances modeling and case studies and tool demonstrations

Structural Dynamic Analysis with Generalized Damping Models Sondipon Adhikari, 2013-12-11 Since Lord Rayleigh introduced the idea of viscous damping in his classic work The Theory of Sound in 1877 it has become standard practice to use this approach in dynamics covering a wide range of applications from aerospace to civil engineering However in the majority of practical cases this approach is adopted more for mathematical convenience than for modeling the physics of vibration damping Over the past decade extensive research has been undertaken on more general non viscous damping models and vibration of non viscously damped systems This book along with a related book Structural Dynamic Analysis with Generalized Damping Models Identification is the first comprehensive study to cover vibration problems with general non viscous damping The author draws on his considerable research experience to produce a text covering dynamics of viscously damped systems non viscously damped single and multi degree of freedom systems linear systems with non local and non viscous damping reduced computational methods for damped systems and finally a method for dealing with general asymmetric systems The book is written from a vibration theory standpoint with numerous worked examples which are relevant across a wide range of mechanical aerospace and structural engineering applications
