Statistical Methods for Hospital

Monitoring with R Anthony Morton, Kerrie L. Mengersen, Geoffrey Playford, Michael Whitby, 2013-06-27 Hospitals monitoring is becoming more complex and is increasing both because staff want their data analysed and because of increasing mandated surveillance. This book provides a suite of functions in R enabling scientists and data analysts working in infection management and quality improvement departments in hospitals to analyse their often non independent data which is frequently in the form of trended over dispersed and sometimes auto correlated time series. This is often difficult to analyse using standard office software. This book provides much needed guidance on data analysis using R for the growing number of scientists in hospital departments who are responsible for producing reports and who may have limited statistical expertise. This book explores data analysis using R and is aimed at scientists in hospital departments who are responsible for producing reports and who are involved in improving safety. Professionals working in the healthcare quality and safety community will also find this book of interest. *Statistical Methods for Hospital Monitoring with R* Provides functions to perform quality improvement and infection management data analysis. Explores the characteristics of complex systems such as self organisation and emergent behaviour along with their implications for such activities as root cause analysis and the Pareto principle that seek few key causes of adverse events. Provides a summary of key non statistical aspects of hospital safety and easy to use functions. Provides R scripts in an accompanying web site enabling analyses to be performed by the reader. http://www.wiley.com/go/hospital_monitoring Covers issues that will be of increasing importance in the future such as generalised additive models and complex systems networks and power laws.

Statistical Analysis of Empirical Data Scott Pardo, 2020-05-04 Researchers and students who use empirical investigation in their work must go through the process of selecting statistical methods for analyses and they are often challenged to justify these selections. This book is designed for readers with limited background in statistical methodology who seek guidance in defending their statistical decision making in the worlds of research and practice. It is devoted to helping students and scholars find the information they need to select data analytic methods and to speak knowledgeably about their statistical research processes. Each chapter opens with a conundrum relating to the selection of an analysis or to explaining the nature of an analysis. Throughout the chapter the analysis is described along with some guidance in justifying the choices of that particular method. Designed to offer statistical knowledge to the non specialist this volume can be used in courses on research methods or for courses on statistical applications to biological medical life social or physical sciences. It will also be useful to academic and industrial researchers in engineering and in the physical sciences who will benefit from a stronger understanding of how to analyze empirical data. The book is written for those with foundational education in calculus. However a brief review of fundamental concepts of probability and statistics together with a primer on some concepts in elementary calculus and matrix algebra is included. R code and sample datasets are provided.
