**Applying FMEA in the knitting process** Inkeri Walser, 2007-05-21 Diploma Thesis

from the year 2006 in the subject Textile Print Crafting grade 17 Albstadt Sigmaringen University language English abstract

This diploma thesis APPLYING FMEA IN THE KNITTING PROCESS shows how to develop a FMEA in the production process

of the knitting department The quality control shows several important defects which have to be improved and reduced The

FMEA Failure Mode and Effect Analysis is an analysis to detect and prevent potential failures and defects in the quality

assurance While getting familiar with the production procedure of knitting fabric the idea to develop a FMEA became more

interesting In the textile industry the used methods for predicting quality assurance are still not very common The knitting

department is still using a classic strategy of analysing and preventing defects First there was the need to define a

responsible team to develop a FMEA process The team members are selected from different areas in the production To learn

about the purposes and benefits of an FMEA the chief of the team should visit a training program for moderators The process

FMEA includes 13 steps to follow and conduct a FMEA Process FMEA because it focuses on the failure modes caused by

process or assembly deficiencies The most important reason for conducting a FMEA is to improve its process and quality The

first step in developing a FMEA is to define the complete production process of knitting Therefore it is necessary to identify

the detailed functions of the workstations Further the most important and critical defects have to be defined with its causes

and defects The Cause Effect Diagram is a helpful method to analyse the root causes The defects are listed by its appearance

according to the functions in the process It is important to do an analysis of the total percentages of defects before starting

to apply the FMEA process in the procedure Risk evaluation is in charge of evaluating the defects according to severity

occurrence and detection The ranking system is between 10 and 1 in which 10 identifies a very high risk and 1 a minor risk

Severity applies to the importance of the defect occurrence to the frequency and detection to the efficiency of detecting the

defect At last the Risk Priority Number RPN is calculated by multiplying severity by occurrence and by detection to define

the total potential failure or defect Recommended actions are to be defined in order to give solution and reduce the problems

in the procedure
