Abstract and background: There are a number of reasons why the use of a single, one-dimensional measure of health-related quality of life (HRQL) is inadequate. The purpose of this study was to compare the use of a single measure of HRQL with the use of a multi-dimensional measure of HRQL in a clinical trial. Methods: A randomised controlled trial of a new treatment for a chronic condition was conducted. The primary outcome was the change in a single measure of HRQL. The secondary outcome was the change in a multi-dimensional measure of HRQL. Results: The single measure of HRQL was found to be inadequate for the purpose of the trial. The multi-dimensional measure of HRQL was found to be more appropriate. Conclusion: The use of a multi-dimensional measure of HRQL is more appropriate than the use of a single measure of HRQL in a clinical trial.
