Breckle,1989-08-17 By the end of the last century the only region in all of Europe where the natural vegetation remained untouched over large expanses was Eastern Europe Information on the vegetation of this region however remained mostly unavailable to western scientists although the ecological approach to botanical research originated in Eastern Europe

Heinrich Walter was born in Russia studied Natural Sciences with emphasis on botany in Odessa and is familiar with all relevant Russian literature on ecology This volume thus offers scientists worldwide a unique and comprehensive survey of all relevant research including the mostly unknown literature published in Russian

Vegetation of the Earth and Ecological Systems of the Geo-biosphere Heinrich Walter,2012-12-06

Phytomass and Primary Production of the Various Vegetational Zones and of the Entire Biosphere The biosphere is that thin layer at the earth's surface in which living organisms exist and biological cycling takes place It includes the upper horizons of the soil in which plants root the atmosphere near the ground insofar as organisms penetrate this space and all the surface waters More than 99% of the earth's biomass is phytomass to which we shall limit our discussion Amounts of phytomass are distinctly related to vegetational zones Because accurate determination of phytomass and primary production is difficult only gross estimates have been available until recently However in 1970 Bazilevich et al published in Russian more accurate calculations based on the rapidly accumulating literature for the various thermal zones and bioclimatic regions of the earth These authors calculated mean phyto mass and mean annual primary production for the various regions as dry mass in tons

per hectare On the basis of measurements of the areas covered by the individual regions excluding rivers lakes glaciers and permanent snow total phytomass and total annual primary production for the various regions were obtained see table The sum of these figures is the phytomass and annual production of the land surface of the earth In addition the table gives corresponding data for the waters of the earth The values involved are potential i e they are based on natural vegetation uninfluenced by man

Siegmar-W. Breckle,M. Daud Rafiqpoor,2022-11-07 Vegetation soil and climate are the most important components of ecological systems The book represents a compact synthesis of our current knowledge about the ecology of the Earth and is thus the basis for understanding the major interrelationships in a global perspective In the first part with a rich endowment of illustrations and photographic material the well introduced book deals with the essential processes and operations on the Earth s surface that lead to the formation of the vegetation cover with its distinctive zonation In the second part the individual vegetation zones as large scale ecosystems i e zonobiomes of the biosphere are consistently described comparatively according to certain criteria In a short and compact form the main characteristics and structures as well as examples of ecosystem processes are discussed The large scale ecosystems are at the same time the basis and reference system for all anthropogenic changes that have drastically altered the vegetation in the last millennia but especially in the 20th century This book is a translation of the original German 1st edition *Vegetation und Klima* by Siegmar W Breckle and M Daud Rafiqpoor published by Springer Verlag GmbH Germany part of Springer Nature in 2019 The translation was done with the help of artificial intelligence machine translation by the service DeepL com A subsequent human revision was done primarily in terms of content so that the book will read stylistically differently from a conventional translation Springer

Heinrich Walter,1985 *Coviability of Social and Ecological Systems: Reconnecting Mankind to the Biosphere in an Era of Global Change* Olivier Barrière,Mohamed Behnassi,Gilbert David,Vincent Douzal,Mireille

Fargette, Thérèse Libourel, Maud Loireau, Laurence Pascal, Catherine Prost, Voyner Ravena-Cañete, Frédérique Seyler, Serge Morand, 2019-03-12 This book considers the principle of sustainable development which is currently facing a growing environmental crisis. A new mode of thinking and positioning the ecological imperative is the major input of this volume. The prism of co viability is not the economics of political agencies that carry the ideology of the dominant conventional economic schools but rather an opening of innovation perspectives through science. This volume through its four parts more than 40 chapters and a hundred authors gives birth to a paradigm which crystallizes within a concept that will support in overcoming the ecological emergency deadlock.
