Current and comprehensive this foundational volume presents sport and performance psychology from myriad perspectives including individual psychological processes in performance such as attention imagery, superior performance intelligence, motivation, anxiety, confidence, cognition, and emotion; the social psychological processes in performance including leadership, teamwork, coaching, relationships, moral behavior, and gender and cultural issues; human development issues in performance such as the development of talent and expertise, positive youth development, the role of the family, end of involvement, transitions, and both youth and masters level sport and physical activity programs; interventions in sport and performance psychology and counseling of performers in distress including such important issues for all performers as appearance and performance enhancing drug use, injuries, managing pain, eating and weight issues, burnout, and the role of physical activity in maintaining health. **Basal ganglia: physiological, behavioral, and computational studies** Ahmed A. Moustafa, Alon Korngreen, Izhar Bar-Gad, Hagai Bergman, 2015-05-26 The basal ganglia has received much attention over the last two decades as it has been implicated in many neurological and psychiatric disorders. Most of this research in both animals and humans attempt to understand the neural and biochemical substrates of basic motor and learning processes and how these are affected in human patients as well as animal models of brain disorders. The current volume contains research articles and reviews describing basic pre-clinical and clinical neuroscience research of the basal ganglia written by attendees of the 11th Triennial Meeting of the International Basal Ganglia Society IBAGS that was held March 3-7th 2013 at the Princess Hotel Eilat Israel and by researchers of the basal ganglia. Specifically articles in this volume include research reports on the biochemistry, computational theory, anatomy and physiology of single neurons and functional circuitry of the basal ganglia networks as well as the latest data on animal models of basal ganglia dysfunction and clinical studies in human patients.

**Biology of Aggression** Randy J. Nelson, 2005-08-25 Unchecked aggression and violence take a significant toll on society. Even if we manage to avoid being the direct victim of a violent act, the effects of aggression and violence reach us all. We hear about the mauling of a woman by an aggressive dog, our children are bullied at school, or we deal with impulsive violence while commuting to work or attending a sporting event. Reflecting psychology in general, the dominant roles of learning and

environmental influences both social and nonsocial have traditionally been prominent in discussions of the etiology of human aggression Biological factors have not been considered sufficiently important to investigate in the search for ways of dealing with human aggression or violence With recent advances in pharmacology and genetic manipulation techniques however new interest has developed in the biological mechanisms of both non human and human aggression Although aggression is certainly a complex social behavior with multiple causes molecular biological factors should not be overlooked as they may well lead to interventions that prevent excess aggressive behaviors The primary goal of this book is to summarize and synthesize recent advances in the biological study of aggression As most aggressive encounters among human and non human animals represent a male proclivity the research in this book describes and discusses studies using the most appropriate murine model testosterone dependent offensive inter male aggression which is typically measured in resident intruder or isolation induced aggression tests The research also emphasizes various molecules that have been linked to aggression tests The research also emphasizes various molecules that have been linked to aggression by the latest gene targeting and pharmacological techniques Although the evidence continues to point to androgens and serotonin 5 HT as major hormonal and neurotransmitter factors in aggressive behavior recent work with GABA dopamine vasopressin and other factors such as nitric oxide has revealed significant interactions with the neural circuitry underlying aggression This book is organized according to levels of analysis The first section examines the genetic contributions to aggression in species ranging from crustaceans to humans The section summarizes the involvement of various neurotransmitters and neuromodulators in aggressive behavior The third section summarizes the influence of hormones on aggression primarily in humans All chapters emphasize future directions for research on aggression and reveal important domains that have received comparatively less attention in this literature Considered together these chapters provide up to date coverage of the biology of aggression by some of the leading authorities currently working in this field Biology of Aggression will direct future research to continue the recent advances in the pharmacological and genetic approaches to understanding aggression and violence It promises to be a valuable resource for professional and student researchers in neuroscience psychiatry cognitive and developmental psychology behavioral biology and veterinary medicine
