Iterated Maps on the Interval as Dynamical Systems

Pierre Collet, J.-P. Eckmann, 2009-08-25 Iterations of continuous maps of an interval to itself serve as the simplest examples of models for dynamical systems. These models present an interesting mathematical structure going far beyond the simple equilibrium solutions one might expect. If in addition the dynamical system depends on an experimentally controllable parameter, there is a corresponding mathematical structure revealing a great deal about interrelations between the behavior for different parameter values. This work explains some of the early results of this theory to mathematicians and theoretical physicists with the additional hope of stimulating experimentalists to look for more of these general phenomena of beautiful regularity which oftentimes seem to appear near the much less understood chaotic systems. Although continuous maps of an interval to itself seem to have been first introduced to model biological systems, they can be found as models in most natural sciences as well as economics. *Iterated Maps on the Interval as Dynamical Systems* is a classic reference used widely by researchers and graduate students in mathematics and physics, opening up some new perspectives on the study of dynamical systems.

Iteration Theory - Proceedings Of The European Conference C. Simo, Christian Mira, Gyoergy

Targonski, Norbert Netzer, 1991-07-22 The main topics of this proceedings stress the interactions between the theory of functional equations and the theory of dynamical systems. A total of 38 invited lectures are included.

Spontaneous

Formation of Space-Time Structures and Criticality T. Riste, David Sherrington, 2012-12-06 This volume contains the proceedings of a NATO Advanced Study Institute held at Geilo, Norway, between 2-12 April 1991. This institute was the eleventh in a series held biannually at Geilo on the subject of phase transitions. It was intended to capture the latest ideas on self-organized patterns and criticality. The Institute brought together many lecturers, students, and active researchers in the field from a wide range of NATO and non-NATO countries. The main financial support came from the NATO Scientific Affairs Division, but additional support was obtained from the Norwegian Research Council for Science and the Humanities, NAVF, and Institutt for energi- og teknikk. The organizers would like to thank all these contributors for their help in promoting an exciting and rewarding meeting, and in doing so are confident that they echo the appreciation of all the participants. In cooperative equilibrium systems, physical states are described by spatio-temporal correlation functions. The intimate connection between space and time correlations is especially apparent at the critical point of the second-order phase transition, where the spatial range and the decay time of the correlation function both become infinite. The salient features of critical phenomena and the history of the development of this field of science are treated in the first chapter of this book.
