

# NATURE VS NURTURE

Nature versus nurture is an ongoing debate about the degree to which human behaviour is determined by genetic inheritance (nature) or learned through interactions with the environment (nurture).

## NURTURE

Explanations suggesting behaviour is determined by the environment and personal experiences. They believe all human characteristics are a result of social and material environmental factors that influence development from birth onwards.

Petrie, M. (1920) conducted a case study on a child known as 'Little Albert' to see if it was possible to condition a child to fear an unfamiliar rat. Resulted object.

- Little Albert showed no fear response to any stimulus before the experiment.
- Little Albert was presented with a white rat. Each time he reached for it, a loud noise was played (unconditioned stimulus). Albert responded to the rat alone crying and rapidly 'locking' away, which took him to his crying fit.
- The fear had been transferred to other looking objects, including a rabbit and a fur coat.
- One month later, Albert continued to show fear reactions to all similar objects. This provided evidence that the environment can manipulate to create a phobic response and behavioural change.

Zimbardo (1972) conducted the Stanford Prison Experiment to investigate the effects that roles and the environment can have on people's behaviour.

- 24 male volunteers were randomly assigned to the role of "guards" or "guards".
- A simulated prison was built in the basement of the psychology building at Stanford University.
- Guards were given authority, uniforms, batons, whistles and dominantly in the body of control and power.
- As a result, guards beat their roles, their behaviour was extremely aggressive, abusive and used various forms of punishment to control the inmates.
- In contrast, the inmates were given few responsibilities and were extremely kind to each other, despite the guards.
- The experiment had to be stopped after just six days.

**The Humanistic Approach** – believes that behaviour is influenced by other personal and environmental factors of the world.

**The Behaviourist Approach** – believes behaviour is learned through a process of conditioning.

**The Social Approach** – explores how people's behaviour is influenced by other person and culture.

## PROBLEMS WITH THE NATURE VS NURTURE DEBATE

1. It is reductionist because it states that behaviour is solely caused by genetic factors or experience.
2. It is deterministic because it suggests behaviour is determined by hereditary factors, while environmental suggest that behaviour is the result of interactions with the environment.
3. It is difficult to control variables. For example, the variables in this study could not be known for sure if it was valid. All influences cannot be isolated.

## NATURE

Naturalists argue that behaviour is caused by innate characteristics that are passed down our ancestors and form our genetic make-up. They believe genes play a part with our behaviour because we are programmed from birth, and innate behaviours are generalised to us through our family tree.

**Genes and Twins** (1980) involved twin and adoption studies to determine whether先天性 or genetic link.

**Adoption studies** found an increased occurrence of schizophrenia in adopted children with schizophrenia parents. Children of schizophrenia parents and adopted parents of schizophrenia children showed little evidence of schizophrenia. This indicates a significant genetic input into the onset of schizophrenia.

**Twin studies** found a higher concordance rate for schizophrenia in identical twins than non-identical twins. On average, there is a 50% probability that both individuals in a pair will have a certain characteristic, given that one of them has that characteristic. Interestingly, there was a concordance rate of 50% in identical twins, compared to 12% in non-identical twins.

**Phenome** (1980) found that the overall heritability of IQ is identical and monozygous twins, which means identical twins share 50% of their genes. However, when only identical twins that have adopted were studied, the heritability rate increased to 0.74, which means they share 74% of their genes. This suggests that the environment influences behaviour, especially in the environment.

**The Biological Approach** – believes behaviour is controlled by the brain, which is made up of three main systems.

## NATURE AND NURTURE INTERACTION

Psychologists generally agree that behaviour is a result of the interaction between nature and nurture.

Psychologists believe that either genes or environment can control behaviour, but they are part of a system. In fact, they are controlled by each other.

**Margulis et al. (2000)** conducted a study on black swans and found that they were not black because they ate black food.

They found various other factors that influenced their colour. For example, they had different diets, different environments and different genes. Their behaviour, appearance, colour, diet, environment and genes all interact with each other to produce the black swan. This illustrates that other factors influence behaviour, not just one gene.

Genes can be seen as causing the typical human behaviour.

For example, most children with autism have similar behaviour.

**The Psychodynamic Approach** – believes behaviour is determined by unconscious and childhood experiences. Dreams and their past experiences are used to explain behaviour.

**The Cognitive Approach** – focuses on how people process information to explain behaviour. For example, people with autism have difficulty with social interaction.

**The Developmental Approach** – believes behaviour is determined by the environment. For example, children with autism have difficulty with social interaction.

Social and Emotional Development in Infancy and Early Childhood Janette B. Benson, Marshall M. Haith, 2010-05-21

Research is increasingly showing the effects of family school and culture on the social emotional and personality development of children. Much of this research concentrates on grade school and above but the most profound effects may occur much earlier in the 0-3 age range. This volume consists of focused articles from the authoritative Encyclopedia of Infant and Early Childhood Development that specifically address this topic and collates research in this area in a way that isn't readily available in the existing literature covering such areas as adoption, attachment, birth order, effects of day care, discipline and compliance, divorce, emotion regulation, family influences, preschool routines, separation anxiety, shyness, socialization effects of television, etc. This one volume reference provides an essential, affordable reference for researchers, graduate students, and clinicians interested in social psychology and personality as well as those involved with cultural psychology and developmental psychology. Presents literature on influences of families, school and culture in one source, saving users time searching for relevant related topics in multiple places and literatures in order to fully understand any one area. Focused content on age 0-3 save time searching for and wading through lit on full age range for developmentally relevant info. Concise, understandable and authoritative for immediate applicability in research.
