Rampelotto,2020-01-02 In this book researchers and practitioners working in the field present the major promises of algae biotechnology and they critically discuss the challenges arising from applications Based on this assessment the authors explore the great scientific industrial and economic potential opened up by algae biotechnology The first part of the book presents recent developments in key enabling technologies which are the driving force to unleash the enormous potential of algae biotechnology The second part of the book focuses on how practical applications of algae biotechnology may provide new solutions to some of the grand challenges of the 21st century Algae offer great potential to support the building of a bio based economy and they can contribute new solutions to some of the grand challenges of the 21st century Despite significant progress algae biotechnology is yet far from fulfilling its potential How to unleash this enormous potential is the challenge that the own field is facing New cultivation technologies and bioprocess engineering allow for optimization of the operation strategy of state of the art industrial scale production systems and they reduce the production costs Parallel to this new molecular technologies for genetic and metabolic engineering of micro algae develop quickly The optimization of existing biochemical pathways or the introduction of pathway components makes high yield production of specific metabolites possible Novel screening technologies including high throughput technologies enables testing of extremely large numbers of samples and thus allow for large scale modelling of biomolecular processes which would have not been possible in the past Moreover profitable production can demand for integrated biorefining which combines consecutive processes and various feedstocks to produce both transportation fuel electric energy and valuable chemicals      Bioenergetics of Photosynthesis Govindjee,1974 Introduction to photosynthesis Chloroplast structure and function Primary events and the trapping of energy Excitation energy transfer and migration theoretical considerations Luminescence Chlorophyll fluorescence an intrinsic transport chain in chloroplasts Oxygen evolution in photosynthesis Mechanisms of photophosphorylation Energy conservation in the functional membrane Structure of the chloroplast membrane relation to energy coupling and ion transport Molecular organization of chlorophyll and energetics of the initial stages in photosynthesis      **Algae for Biofuels and Energy** Michael A. Borowitzka,Navid R. Moheimani,2012-12-11 Microalgae are one of the most studied potential sources of biofuels and bioenergy This book covers the key steps in the production of renewable biofuels from microalgae strain selection culture systems inorganic carbon utilisation lipid metabolism and quality hydrogen production genetic engineering biomass harvesting extraction Greenhouse gas and techno economic modelling are reviewed as is the 100 year history of microalgae as sources of biofuels and of commercial scale microalgae culture A summary of relevant basic standard methods used in the study of microalgae culture is provided The book is intended for the expert and those starting work in the field      Inorganic Carbon Uptake by Aquatic Photosynthetic Organisms William J. Lucas,Joseph A. Berry,1985 Leading-edge Environmental Biodegradation Research Lyman E. Pawley,2007 This volume presents new leading edge research on environmental biodegradation which is the destruction of organic compounds by micro organisms Micro

organisms particularly bacteria are responsible for the decomposition of both natural and synthetic organic compounds in nature. Mineralisation results in complete conversion of a compound to its inorganic mineral constituents for example carbon dioxide from carbon sulphate or sulphide from organic sulfur, nitrate or ammonium from organic nitrogen, phosphate from organophosphates or chloride from organochlorine. Since carbon comprises the greatest mass of organic compounds, mineralisation can be considered in terms of CO<sub>2</sub> evolution. Radioactive carbon 14 (<sup>14</sup>C) isotopes enable scientists to distinguish between mineralisation arising from contaminants and soil organic matter. However, mineralisation of any compound is never 100% because some of it (10-40% of the total amount degraded) is incorporated into the cell mass or products that become part of the amorphous soil organic matter commonly referred to as humus. Thus, biodegradation comprises mineralisation and conversion to innocuous products, namely biomass and humus. Primary biodegradation is more limited in scope and refers to the disappearance of the compound as a result of its biotransformation to another product. Compounds that are readily biodegradable are generally utilised as growth substrates by single micro organisms. Many of the components of petroleum products and frequent ground water contaminants such as benzene, toluene, ethylbenzene and xylene are utilised by many genera of bacteria as sole carbon sources for growth and energy.
